The Persian state bank was established by the British royal charter of 1889 as the Imperial Bank of Persia. The Banque d'Escompte de Perse is—or was—a Russian government institution. Nasir-u-Din was assassinated in 1896 after nearly 50 years reign. His son Muzaffar-u-Din issued a decree on 5 Aug. 1906 convoking for the first time in Persian history a national assembly called the Mejliss. A constitution, dated 1 Jan. 1907, was confirmed on 11 February by Mohammed Ali Shah after his accession. The latter signed a new constitution in October limiting the sovereign's prerogatives and ecclesiastical authority and granting freedom of speech, press, conscience, of the person, etc. The duties of Parliament and responsibility of ministers were defined. This constitution was violated and abolished by the Shah in November 1908. Under British and Russian pressure he granted another constitution and signed a new electoral law in June 1909. He was deposed by the Nationalists in July and his son Ahmed Mirza, then 11 years old, was appointed Shah. The Mejliss was dissolved in December 1911 and did not meet again till 1915.

Anglo-Russian Intervention.—For a number of years Great Britain and Russia endeavored, unsuccessfully, to formulate a Persian policy which would make the most of those

sporadic elements of progress still to be found in that ill-starred country and leave the nation to lead a quiet but independent life of its own. Though in apparent agreement as to intentions and aims, the British and Russian governments differed fundamentally about the means of achieving them, with the result that they were unable to accomplish anything useful. Each held considerable trade interests in Persia, while the chronic financial embarrassments of successive Persian governments made it necessary to raise foreign loans by mortgaging the customs receipts. Thus, in 1892, Persia contracted a 6 per cent loan of \$2,500,000 from London; in 1897 various attempts were made to raise another foreign loan with the sole result of discrediting the Persian government in Europe. In 1900 Russia permitted the issue of a loan of \$12,000,000 at 5 per cent, guaranteed by all the customs receipts of Persia excepting those of Fars and the Gulf ports. Russia gradually gained control of Persian finance and of the commerce of the northern portion of the country. British interests in Persia may be summed up in one word—India. The preservation of the Indian Empire had influenced the Asiatic policy of Great Britain since the Crimean War. That policy involved the maintenance of independent "buffer states," e.g., Turkey, Persia and Afghanistan against the encroachments of Russia. Persian menaces against Afghanistan repeatedly caused strained relations with England in the first half of the 19th century. In 1856 the British invaded southern Persia as a protest against the Persian capture of Herat. The campaign was brief and the British troops never crossed the Southern Mountains. Persia sued for peace and evacuated Afghanistan. From this campaign dates the introduction of "khaki" (q.v.). In the Persian Gulf Great Britain has acted as "policeman" for over 300 years; in January 1622 British and Persians united in expelling the Portuguese from Hormuz, since when no foreign power has ever obtained a footing upon the Persian coast.

Under the Anglo-Russian treaty of 1907 the whole of northern Persia, to points as far south as Yezd and Ispahan, was declared to be within the Russian sphere of influence. The British sphere was defined as a triangle of southeastern Persia, the line being drawn from Bander Abbas through Kerman to Birjand and the Afghan frontier. The remainder of central and southern Persia, including the whole Persian coast of the Gulf, was declared to be a neutral sphere. Both governments engaged to respect the integrity and independence of Persia and to institute a control over the sources of revenue (within their respective spheres) in case of irregularities arising in the redemption or payment of interest on Persian loans. Persia became a party to this convention in 1912. After the fall of Mohammed Ali (1909) a regency was appointed and the Mejliss reassembled. Reform was a difficult task; the reformers were inexperienced and the treasury was empty. There was no organic bond between people and Parliament; many of the deputies were appointed by the government and the Mejliss itself nominated others. In 1911 Mr. W. Morgan Shuster, an American financial administrator selected by President Taft, was invited to Persia to take

control of the finances. Mr. Shuster made a tactical mistake in refusing to recognize the Anglo-Russian agreement, by which he drew upon himself the inevitable hostility of Russia. A series of Russian interventions in questions of administration proved that that government interpreted its rights in a manner not consonant with the agreement. When Mr. Shuster chose Major Stokes, a British officer who spoke Persian, as commander of the gendarmerie to secure the collection of the taxes, the appointment was vetoed from Saint Petersburg on the ground that no Englishman could exercise authority in the Russian sphere. After eight months of uphill but fruitful effort, continually interrupted by friction with Russia, Mr. Shuster was dismissed by a Russian ultimatum, which was approved by Sir Edward Grey. With regard to Great Britain, support of Russian claims in Persia was the price of the treaty of 1907, as support of French claims in Morocco was the price of the treaty in 1904. If those claims went further than was expected or approved by the British government, the European situation in 1912 rendered it difficult—if not impossible—to challenge them. After the departure of Mr. Shuster in January 1912 the country relapsed into hopeless anarchy. Russian troops were stationed in the north in various large towns for the maintenance of order and the protection of Russian interests. In the south, where disorder was more rife, Great Britain took very limited steps of a like character. Bands of brigands roamed the country attacking travelers and their escorts.

Persia and the War.—Though Persia remained neutral her territory was invaded near Mount Ararat where the frontiers of Russia, Turkey and Persia meet. (See WAR, EUROPEAN). In 1914 the British government advanced £50,000 (\$250,000) and subscribed \$11,000,000 to the share capital of the Anglo-Persian Oil Company. During 1915 German influences directed against Great Britain and Russia fomented disorders which led to the Persian gendarmerie revolting against the government and the murder of a British and a Russian vice-consul. A Russian force advanced upon Teheran to protect the legations. The gendarmerie was disbanded in 1916 and the Persian government accepted a British offer to place at their disposal a number of British officers to organize a new force. Within eight months Brig.-Gen. Sir Percy Sykes with three Indian officers had recruited an efficient force of 5,000 men and marched over 1,000 miles restoring order and suppressing bands of marauders. In January 1918 Persia asked Russia to withdraw her troops. Trotzky, the Bolshevik Foreign Minister, denounced the Anglo-Russian agreement. In May 1918 Persia informed Holland that she regarded that agreement and all other treaties imposed on Persia in recent years as null and void. To relieve distress and famine in Persia the American Committee for Armenian and Syrian Relief established a centre at Teheran and spent \$2,000,000 during the famine in 1917-18. The young Shah expressed his gratification by subscribing \$100,000 to the Fourth Liberty Loan, 3 Dec. 1918.

PERSIA, ORDERS AND DECORATIONS. See ORDERS, ROYAL, AND DECORATIONS OF HONOR.

PERSIAN ART. One may assume, for the purpose of easier classification, two main subdivisions of Persian art, viz., the early period ending with the Mohammedan conquest of the country, and the period beginning with the latter point and ending with the present. And in the term "art" it is well to include not only architecture and sculpture, but all forms of painting and artcraft which exemplify and illustrate so large a portion of the Persian artistic genius as well. Doubtless Persian art received its first stimulus from Babylonian sources, filtering in by way of Sogdiana (Susiana). But very little is known about this for certain. There are, to be sure, a few references, or which seemingly purport to be such, to such a process in the early Sacred Scriptures of the Persians, but those are not

plain in their meaning, cite no details and give no dates at all. So much, however, has been ascertained that no vestige of any prehistoric or very early Iranian art has survived. This indeed is no wonder when we keep in mind what has of late years been established irrefragably, namely, that the very beginnings of Persia do not go back farther than the immigration era, lasting probably for many centuries, when hordes of adventurous tribes (the forefathers of the Persians), many of them nomads and on a low plane of development, crossed over into the Iranian Plateau from India, coming in shoals large and small and settling on their new-found lands. This process of gradual immigration must have antedated, of course, an autochthonous civilization of their own. The so-called Median period (B.C. 700-550) is the most ancient we can deal with definitely as to a Persian art life. But the records are rather meagre. It is true we read of the architectural wonder of the royal palace at Ecbatana, the Hamadan of our day, but Herodotus, our authority, tells only of what he has heard and not of what he has himself seen. And his descriptions are rather vague. Polybius later on speaks glowingly of the "gold-plated edifices" at Anatis, the city named after the Persian river goddess, and furnishes some details, such as the "silver roof tiles." These Greek accounts all refer to several centuries before Alexander the Great overthrew and trampled under foot the Persian Empire, and Ecbatana was the capital of the Median state. When Persia fell and crumbled at Issus and Granicus, untold artistic treasures in precious metals were carried off by the plundering soldiery, spoil from the outside and inside of the royal palaces and temples. But that the style of architecture exhibited by the early Medians and Persians was stiff and somewhat conventional, consisting mainly in foundations of enormous platforms or terraces, upon which were reared the buildings themselves, seems certain. Not only that, but the Medians and after them still more the Persian architects borrowed all around from their neighbors to produce effects, from the Egyptians most, from the Assyrians, the Lydians and others. Most prominent of the remains of Persian art that have come down to us are the tombs of the kings belonging to the great Achæmenid dynasty. The tomb of Cyrus in Pasargadæ reveals Hellenistic influences, but the others are different. Cubic masses of rock are surmounted by a flattened pyramid, with little of ornamentation. Egyptian models evidently inspired the forms of these tombs. The tomb of Darius in Persepolis is, however, carved into the living rock itself. Egyptian *motifs*, too, governed in the erection of the palace of Darius—the same doors and gates, the same architraves and cornices as in the pharaonic ruins of Memphis. In front of the wide entrance ascends a terrace of 1,100 steps, leading direct to the throne hall, and further on is the hall of Darius with its 100 pillars. The palaces of Susa and Ecbatana are built on the same general plan. And the architectural skill displayed by the Arsacids, as shown by the remains of the great palace of Servistan, leaned still more on Egyptian models. What is left of the Sassanide palace at Ctesiphon, erected by Chosroes I., exhibits Coptic influences. The ruin shows a nave 80 feet long and 150 feet deep, covered

by an elliptic cupola 110 feet high. It is everywhere observable that the Persians, while borrowing freely in spirit and form of architectural plans from foreign nations, made the highly original interior decorations chiefly their own concern. The columns supporting the audience hall of Darius, for instance, are irreplicable with their elegant shape and just proportions, the capitals showing bullsheads of fine design, and exquisite enameled brick and wonderful bas-reliefs everywhere apparent. However, the open-air lofty structures of the Persians, the large and well-lit halls, such as we see in the ruins of Persepolis and Pasargadæ, are admirably adapted to the climate and to their uses, and one feature especially, the delicately tinted and very durable tiles, is noted thus early. Sculpture, both in bronze and hard stone, is massive, somewhat uncouth, though possessing rugged strength. But it is rather monotonous; the groups of combat showing the slayer of lions and bulls as a victor,—nearly always typifying a ruler or a god,—recur too frequently. When Persia was at its zenith, the time of Darius, enameled bricks of cement, with relief pictures in brilliant colors, pillars (some of them graceful and slender, suggested by the palm tree, such as the one left in a ruined temple near Kermanshah) with voluted capitals in three rising sections, were much used in the palaces and sacrificial buildings. Then there was a rapid and steady decline, all through the Parthian and Sassanide period, with occasional Hellenistic or Arabic influences apparent. No specific style of art is seen till after the Moslem conquest. And the bastard Greek art flourishing along the shores of the Black Sea is often noticeable during these first centuries of the Christian era. So, too, in the specimens of the coiner's, the gold and silversmith's skill that have survived. Sculpture died with the Arab invasion of the 7th century, in consonance with the Koranic injunction. Not so, however, the art of painting in all its branches. On the whole, architecture in Persia has made no strides forward during the last 1,000 years. On the contrary, nothing of equal value has taken the place of the stately piles of ancient times. Private buildings while generally of rather graceful outlines are made of cheap and flimsy material, even the Shah's palaces, villas and shooting boxes being no exception. For the style of the mosques and *medressehs* the Arabs stood sponsor, although there is an occasional exception, such as the famous mosque at Koum, with its bronze cupola. On the other hand, despite Mohammed's prohibition of representing the human figure, painting has progressed greatly in Persia since the adoption of Islam. Her artists for many centuries past have excelled particularly in the field of miniature painting, in all its branches. Some really good specimens of portraiture may still be seen in the Shah's extensive palaces and pavilions in Teheran and in some of the houses of wealthy Persians. But as battle painters, as painters of harem and family life, as decorators of costly furniture, and above all as illuminators of manuscripts the Persians have accomplished considerable. Much of this work is covered with a thin lacquer coating to withstand wear, and the mingling of colors is nearly always highly harmonious and yet original. Illuminating manuscripts, outdoing the achieve-

ments of our own mediæval monks, are still being produced in every art centre of Persia, such as Ispahan, Tabriz, Teheran, Shiraz, Hamadan, etc., that vie with the best. But this style of art is of relatively recent growth, for scarcely anything remarkable exists much antedating 1400. Bihzād (who flourished at the Saffanide court, 1460–1525) was the greatest of these painters. One very peculiar feature of this style of art is its minute faithfulness to life, its realism, the microscope being often required to discern its details. Mikrāk, some time later, who did most of his work in Bokhara, was pastmaster with a peculiarly florid brush. Under Shah Abbas the Great and Nadir Shah, two conquering rulers with open purses, there was a whole school of highly efficient artists of this type. Many illuminated manuscripts brought rewards of between \$2,000 and \$10,000 from the royal treasury. Of battle paintings, done in the miniature manner, there are still some veritable masterpieces extant and in good condition. The greatest battle painter of Persia, Ali Kūli Begh, thus glorified the reign and the victorious campaigns of his patron, Abbas the Great, who about 1600 invaded India. From the time of Nadir Shah, 150 years later, there is yet in existence a fine battle picture, less than a foot square, but on which not less than 1,200 human figures are distinctly portrayed, some of them plainly showing, though in microscopic dimensions, the passions that tore the combatants. The king himself, on a white charger, is seen with his viziers and a group of warriors surrounding him, while in the distance the fight still rages.

Included must be also artcraft, such as ceramics, rug weaving, decorations of arms, etc., in all of which Persia has achieved much for ages. The silken rugs of Persia still lead. The choicest of these dainty rugs come from Feraghān, Kermān, Shirāz and Khorassān. Their soft colors blend marvelously. One priceless prayer rug in Shah Nasr ed-Deen's treasury is said to be 650 years old and of indescribable charm. A brief *sura* of the Koran was woven into the texture in thin gold thread, and Allah's throne above it, with turquoise and rare rubies encrusting it. Besides these art rugs, serving for ornament or wall decoration mostly, the woolen and felt rugs of Persia, some of them heavy and very durable, and often of wondrous design, must be mentioned. Finely tempered steel weapons and artistic metal work of every kind, hammered ware, scimitars, bucklers, scale armor and net cuirasses, etc., are also a Persian specialty. Threaded and inlaid work, often showing floral designs of rare beauty, wrought in bullion, and set in precious stones, the whole embellishing mirror frames, wall cupboards, tiny tables, etc., and carved and grilled work in sandal, teak, cedar, camphor wood, likewise bear testimony to the innate art spirit of Persia. Though with the invasion, in 1722, of the Afghans under Ameer Mahmoud, the secret of the manufacture of the peculiar Persian tinted and glazed pottery and "fayences," even of the marvelous tilings, made up to that period, seems to have been lost forever, there is a good deal of this artistic ware still in the country. Some of the mosques in Persia are coated on the outside with these wondrous tiles, the latter being of a delicate blue, brilliant black or

soft pink hue. The making of fine glazed pottery and chinaware was learned directly from the Chinese, and from the 13th to the 18th century the industry flourished in Persia. A delicate apple green found on many of the old Persian pieces can only be duplicated by the rarest of old china pieces.

WOLF VON SCHIERBRAND,
*Author of 'America, Asia and the Pacific';
formerly Secretary to American Minister to
Teheran, Persia.*

PERSIAN GULF, sometimes called an arm of the Indian Ocean, 520 miles long, 150 to 200 miles wide, with an area of 95,000 square miles, and a depth rarely exceeding 170 feet, and varying so slightly as to make navigation remarkably safe. The Strait of Ormuz, 30 to 60 miles wide connects it with the Gulf of Oman, which opens directly from the Arabian Sea. The entire gulf is the product of the same geological force which traced the course of the Tigris and of the Euphrates. The coasts are calcareous, flat and sandy on the Arabian side and high and sheer on the Persian side. Among the islands of the Gulf are Ormaza, Kishm and the Bahrien group, the last being an early home of Chaldæan civilization, one of the traditional sources of the Phœnicians and the source of important pearl fisheries. The fauna contains some peculiar specimens; tiny sea-animals give the water not only a phosphorescent hue, but so green a tinge that the Arabs called it the Green Sea. Its economic importance is due to the excellent fishing, notably for pearl-oysters, which are annually worth about \$2,500,000 and employ 70,000 fishermen and 6,000 barks. Great Britain practically controls the Gulf. Russian influence in Persia is often reckoned as aiming at the concession of a port there to be reached by a railroad line from the Trans-Caspian province.

PERSIAN LANGUAGE. Just as Persian literature, in the narrower and stricter sense, so also the Persian language is only about a thousand years old, although it must be admitted that the difference between the modern tongue and that spoken say some 2,000 years ago by the ancient Persians is scarcely as great as is, for instance, that between the French, German or English of the earlier Middle Ages and that of to-day. (See also IRANIAN LANGUAGES). Essentially modern Persian is the slow outgrowth of the stately and sonorous idiom of the Avesta or the Gāthas, the Zend, but in the sloughing process has lost much of its one-time majesty and beauty, though on

the other hand it has enormously enriched itself by adopting throngs of foreign words (mostly Arabic and Turkish), until it is more fit to express every mood and even the most delicate shade of an idea than is any other Oriental language. During the more than three centuries that Persia dumbly had lain under the heel of the Arab conqueror every vestige almost of national Persian thought had been stamped out, the very vernacular of the humbled people tabooed, and when finally Persia once more arose, a new idiom rose with it from the womb of obscurity. The mentality, too, of the nation had been changed. Islam with its wholly different code had powerfully impressed itself on mind and morals of the new Persians, and the new speech faithfully mirrored these marked alterations. The present cultivated form of Persian is called *deri* by the Persians themselves; it is a "court language," in distinction from the popular dialects, which latter have withstood, throughout all the political vicissitudes, the insidious influence of court favor much better. Each province of Persia has a dialect of its own, those of Shirāz and Ispahān approximating most nearly with *deri*, while those spoken on the shores of the Caspian, in the provinces of Masanderān and Ghilān resemble most of the ancient speech. East of them, in Khorassān, Persian is spoken in the towns, a mixture of Tartar and Turkish outside of them by the nomads of the steppe and the agricultural population. Elsewhere the matter is treated with some more detail.

With the new religion the Persians also adopted the Arabic alphabet (*talik*), at least in the main. The cuneiform system of writing being wholly discarded and buried, the new one was a syllabic system, marking out the consonants, at least in most cases, possessing no special characters for the vowels. To the 28 Arabic consonantal signs were added four specific Persian ones, the *p*, *tch*, *zh* and *g*, while nine of the Arabic characters were dropped as useless. Thus, then, we find five vowels in modern Persian: *a*, *e*, *i*, *o*, *u*. But the manner of enunciating them differs greatly, not only as to provinces but as to individuals. These vowels when written at all are written in the queer Semitic fashion, sharing among them only three characters, and are mostly omitted in the writing when short. Of consonants there are the gutturals *q*, *g*, *gh*, *k*, *kh*, the latter almost identical with the Welsh sign and all of them rather harsh. Then there are the palatals, *tch* and *j*; the dentals, *t*, *d*, *n*; the labials, *p*, *f*, *b*, *m*; the semi-vowels, *y*, *r*, *l*, *v*; the sibilants, *s*, *sh*, *z*, *zh*; and the aspirated *h*. The sounds thus produced tally in the main with those of the Huzvaresh, but have lost several aspirates and have added the *l*. As to the inflection of nouns and adjectives the modern Persian has been entirely deprived of it, whereas in Zend and in Old Persian these forms were rich and expressive. The whole grammar, in fact, has become greatly simplified and reduced almost beyond reasonable bounds. Having absolutely no gender in its extremely bald grammar, Persian cannot give the equivalent of "he," "she," "it," but helps itself by employing separate words conveying the meaning of sex. There are two endings for the plural, *hā* and *an*, the latter being restricted to animate objects. The suffix

rā is used in lieu of the accusative, originally meaning "through," "by means of." The vowel *i*, the so-called *izafet*, is made to do the duty for a variety of purposes. It is really the remnant of the relative pronoun *ya*. Standing between the noun and its qualifiers, it indicates possession, relation, means. The long vowel *ē* is employed, attached to a noun, to indicate aloofness, rarity, singularity, oneness; as *merd-ē*, a single, lonely man. This *ē* is what is left of the Zend *aēva*, meaning "one." There is neither definite nor indefinite article in modern Persian. The pronouns are of pure Iranian stock. In the latter idioms we see an abundance of suffix pronouns, singular and plural: *em*, *et*, *esh*, *emān*, *etān*, *eshān*, and these are added mostly to verbs and nouns, serving the purpose of marking the otherwise lacking cases. The passive voice of the verb is constructed by the use of the auxiliary *shūdan* (to go). The future is formed by prefixing to the shortened infinitive the present tense of *gāhen kerd*: to wish, to will, to be about; and the imperative of this verb is *kūn*. As regards the irregular verbs, which are both abundant and of most frequent and necessary use, they vary both from the regular form of the infinitive and imperative. The tenses of the indicative are the preterit, the imperfect (by giving the preterit the prefix *mī* or *hamī*), the indefinite present or aorist, the true present (made by giving the prefix *mī* or *hamī* to the aorist), and the future, marked by the prefix *bi*. The comparison of the adjective is made by adding *tar* for the comparative and *tarīn* for the superlative. The manner of stating a fact or conveying an idea in Persia differs as a rule somewhat from the Western fashion, in fact from the mode in vogue in all European tongues. Thus, to say "my father," the Persian puts it "*pidar hyā manā*," i.e., literally, "father that of me." In his whole speech as in his thinking he, too, abhors a naked fact. One can never pin him down to exact figures, for instance; his way is then to use some such phrase as "more than man can count," "like the sand by the seashore." But here we touch on psychology. Persian has developed away from the original mother tongue or root, the Sanskrit, by substituting the letter *h* for the Sanskrit *s*, as shown in the word *sindhu* (Indian and Indus) to *hindu* (Zend); *hindu* (Old Persian), and *hind* (Modern Persian), and in many others. The original aspirates *gh*, *dh*, *bh*, became *g*, *d*, *b*; as in Sanskrit *bhūmi* (earth) to *būmi* (Zend), *būmi* (Old Persian) and *būm* (Modern Persian). Again the letters *k*, *t*, *p* change into *kh*, *th*, *f* before consonants, and the hard sibilant *s* of the Sanskrit becomes the soft sibilant *z* in Persian; as in *Asurō Medhās*, to *Ahurō Mazdēo*, *Aura Mazda*, *Ormuzd*. There was a lapse of fully five centuries, the time when Alexander the Great destroyed the Persian Empire until the rebirth of the country under the national Sassanide dynasty, A.D. 220, when there reigned a complete dearth of literary production. Not a line, not a word has come down to us from this long Arsacide period, and even the Persian coins preserved were Greek in workmanship and in imprint. But Persia after this long lapse was still Persia. And when Persia awoke once again from its second dreamless slumber of

three centuries' duration, a sleep in which it had been prostrate under the heel of its Arab and Moslem lords the same uncanny fact strikes us once more. The tongue of Persia has survived. What the great Firdûsi uses as the vehicle of expression in the "Shah Namêh" is again veritable Persian with an astonishingly small infusion of Arabic, circumstances considered. It is nearly a pure Iranian dialect he employs; so does the Persian translation of Tabârî's "Chronicles." But from the death of Firdûsi (A.D. 1020) on without any tyrannical pressure whatever from above the Persian writers became more and more negligent in this respect. The number of Arabic first and of Turkish words next which are paraded by them in the guise of acquisitions to the Persian language grows steadily. Scientific works not alone are composed in Arabic then and after, but literary works teem with Semitic or Turanian vocables. It would seem that Persian writers for a long time took a pride in turning out works in such bastard Persian, and not writers alone—courtiers, officials, rulers, even priests, out of sheer pedantry and affectedness employed it, so that half the words used were often of foreign origin. And this tendency, sad to say, has continued uninterrupted for nearly a thousand years; it is deplorable from a philological point of view, since Persian is by rights one of the richest and most flexible, sonorous and elegant idioms in existence, one which could afford to stand altogether on its own bottom. The ease with which Persian lends itself to composition of every type is very great, owing to the latitude given the writer in forming new compounds, often very bold experiments, such as epithets made up of compound adjectives and nouns, of two nouns, of nouns and verbs, of verbal phrases, of nouns and prepositions. Quite characteristic, too, is the manner in which a compound or derivative verb is combined with an adjective or noun, or else with one of the large number of semi-auxiliaries, such as "to do," "to make," "to bring," "to have," "to show," "to come," "to take," etc. But Persia, though politically it has declined for the space of several centuries, has in its language a treasure which will not stay buried. The opulence and inexhaustible resources of it await merely the hand of another genius, like one of the past, to give the language a second golden age.

Teheran, Persia.*

PERSIAN LITERATURE. Of ancient Persian literature only fragments of a religious character are left. Persian literature in the stricter sense takes its rise shortly after the settlement of the Arab conquerors, after the utter downfall of the Sassanides and the forcible conversion of the Persians to Moham-medanism; that means, therefore, since the growth of the modern Persian language. To judge correctly the importance of Persian literature proper it must be borne in mind that it was very largely instrumental in building up once again the entire Persian race; that its spread was more than commensurate with the spread of the Persian language itself to far beyond its proper boundaries, all over India, in fact, where for a number of centuries it was one of its chief centres and attained to great lustre; that of all modern Oriental literature it is by far the most comprehensive and varied, the most elegant and refined and that—just to cite but one case of its pervasive influence—the thoughtful, gracious verse of the "tentmaker," Omar Khayyam, in Fitzgerald's translation (undoubtedly an improvement on the original) has become almost a sort of literary vademecum with the intellectual elect of every western nation. The subtle charm of Persian literature even drew the Tartar and Mongolian hordes into its net. Only in drama it is weak and negligible. The passion play, or *tazieh*, as regularly performed in the Persia of our days in each Muharrem, the month of mourning for the slaughter of Hussein, is more like our mediæval mystery plays; it glorifies the rise of the Shiah split within Islam and is scarcely to be accounted a literary factor. Of late years, though, there has been noticed a widening of the scope in drama. But with that exception, albeit a telling one, Persian literature is singularly copious, all-embracing and vivid, cultivating every branch and every style of writing, from the most courtly, grave and dignified to the most debonnaire, scurrilous or spirited. One other peculiarity must be noted. Persian literature is also the fountain head of Soofeism—that deep-tinged scepticism which even to-day pervades the mind of the educated classes of Persia. The sketch here given cannot, of course, make pretension to completeness. It can merely outline the vast field. Persian literature excels in poetry, the graceful idiom and its vast vocabulary adapting itself admirably to it. A tradition more or less leaning on fact relates how as early as the time of Bahrâm Gôr (A.D. 420-438), that prince invented the art of versification. Aufi, in his work on literary history, about 1180, even quotes a few rhymed lines of this crowned poet, who is answered in kind, on the spur of the moment, by his beloved slave, Dilârâm, she employing the same metre and syllabification. During the reign of another Sassanide, Chosroes Pahrwis, there certainly lived a poet, Barbêd. And it seems quite certain that even during the dark days of Arab Moslem rule that followed the total destruction of the Sassanides and of Persian national life

and institutions there lingered on in the soul of the Persian people, the love of poetry, of legendary and national epic lore. But only after the dissension growing out of the warring claims to the caliphate and the rise of Sheeism in Persia and thus of a rebirth of nationalism, modern Persian poetry sprang into full light. The Tahiridas, Saffarides and Samanides, short-lived reigning houses, A.D. 819-999, assisted and cherished this movement. Next, the Ghaznavis (from 976 on) and the Seldjuks (after 1037) as well as even the rude and untutored Tartar and Mongolian chieftains under Genghis Khan and his successors, who overran and ruled all the Iranian plateau, did much in the same line. In fact, Persian literature for the space of four centuries, i.e., during the period of its greatest splendor, owed much to the favor of rulers and courts. This favor, too, was responsible for an entire school of Persian poets — the panegyrists one might call them. The first period, however, that of about 900-1100, gave fruition to the purest and most characteristic Persian heroic poetry. There is first, the great Rûdaki (d. about 950), the author of 100 volumes of poems, of which, though, but little has come down to us. Some 50 of his lays only have been printed in their original text and a translation. Kaboûs, a ruler of Ghilân, with his book in 44 chapters, the 'Kaboûs Nameh,' gave a standard work on princely manners and virtues still acknowledged throughout the Orient as a model. At the court of the great Mahmoud Ghaznavi (998-1030) poets and savants were assembled and flourished in the sunlight of his favor. It was due to his inspiration and encouragement that a cycle of epics arose, based on ancient Persian traditions and myths. His poet laureate, Unsûri, wrote the heroic tale of 'Wâmik i Asrâ.' His pupils, Farrûkhi and Dakiki, wrote in a similar strain. But outshining them all is Firdûsi, the 'Homer of the Orient,' the author of the 'Shah Nameh' (Book of Kings), in which breathes the pure national spirit of ancient, proud Persia. Indeed, in the 'Shah Nameh,' legend and historic truth are mingled in such masterly fashion that these elements become welded into a splendid homogeneous whole and to the Persian mind at least leave no doubts. Following in the same path, other legendary epics were written by Firdûsi's imitators, such as the 'Djehân Gir Nameh,' the 'Barzû Nameh,' the 'Gershasp Nameh,' etc. Sheikh Abu Saïd (968-1049) wrote spirited quatrains, and Nasr-i-Chosroes (1004-1088) didactic poems showing both depth of thought and high moral aspirations. Tabârî's work was issued in the revised and embellished chronicles of Bal'ami, and Menô-Chehri likewise belongs to this category. During this entire period the ferment of national enthusiasm never flags. But with the next, the 12th century, there is a distinct change in all this. Both panegyrists and fiction writers monopolize the stage. Enveri (d. 1191) was the ablest and subtlest of those court scribes who glorified the barbarian despots or for that matter, any rulers possessed of fat purses, as in their writings they themselves shamelessly admitted. But though Enveri led the list, there were many like him during the period of about 1100-1300, such as Zenâyi, Reshid ed-Deen (1247), Wassâf, Shereef ed-Deen, the historian and apologist of Tamer-

lane and Châkâni Hakâiki. Again, always an important branch of Persian literature, the entertaining or amusing stories, anecdotes, legendary and supernatural tales crowded the pages of the Persian writers of those days. Some of these, like a Persian paraphrase of the fables of Bidpay, Turâmi's 'Nigaristân' (Picture Gallery), the 'Bakhtyâr Nameh,' 'Tuti Nameh,' etc., enjoy wide popularity even to-day. Among the earliest Soofees turning up at this time, Sanâi (d. 1131) is noticeable, with his mystical 'Garden of Truth.' The antithesis to him is Omar Khayyam, the satiric freethinker and charming cynic. Reshid Watwât (d. 1182) writes a compendium of poetical rules. The greatest name, though, during this period is that of Nisâmi, the Boccaccio of Persia, whose love stories are so true to nature and their plots so plausible and well-constructed that they charm the reader even to-day, notwithstanding that the Persian 'ishk' and the English 'love' are by no means convertible terms. The next, the third period of Persian literature, a period synchronizing with the frightful devastation wrought in the whole land by Genghis Khan and his Mongolians, is, nevertheless, the golden age of Persian letters. The three great stars shining in her literary firmament were Sa'adi, Djelal ed-Deen Rûmi, and Ferid ed-Deen Attar. The last-named as the guiding spirit of Persian mysticism. His chief writing, 'Esrâr Nameh' (Book of Mysteries), 'Pend Nameh' (Book of Counsel), and 'Djevahû Nameh' (Essence of Substance) are deeply tinged with Oriental mysticism and not to be appraised at their value without possessing the key, being replete with allusions incomprehensible to the uninitiated. He lived to over 100 and then was slain by the conquering Mongolians during the sack of the city in which he dwelt. Djelal ed-Deen Rûmi was the great founder and the intellectual centre of that Moslem pantheism which even to-day runs through the whole Orient, often side by side with occasional flashes of fierce fanaticism and narrow bigotry, and his writings breathe the spirit of Soofeism throughout. But to the Western world Sa'adi has always seemed greater and closer and more rational as a thinker. In his 'Gulistân' and 'Bostân,' his two chief books, there is a pleasant simplicity of fable and diction, coupled with a sound sapientcy that are touching. Sa'adi, too, passed the ordinary span of life allotted to man, and is said to have died at the more than venerable age of 120. His Persian biographers usually divide his life into periods of 30 years, he devoting himself to philosophic travel from 60 to 90, and the last space of equal length to writing down his manifold experience. This, however, is probably one of those flowery inaccuracies of the Oriental mind with which we are constantly struck when sounding it. It is true, however, that Sa'adi's life was long and full of vicissitudes, he being, among other things, a prisoner of the Crusaders for years; that he wandered far and wide and often knew hunger and thirst, and that he did his writing in his very old age.

The period of 1300-1400 was, in one respect at least, the most brilliant for Persian letters. It is curious to note that it was precisely during this time, the time when the whole Iranian world was groaning under the Mongolian yoke and politically in the very depths of abasement,

that Persia reached her literary zenith, certainly in the field of lyrics. Her greatest poet, one who as yet is quite insufficiently appreciated in the West (owing, doubtless, in part to inadequate translation), Hafiz, that is, sang his sweetest and gayest. Tuneful and multicolored they are, his lyrics, covering an immense range of human emotions, though with "love, roses and wine" predominating. Hafiz by common consent figures among the few greatest lyrical poets of all ages and climes. His finished, smooth and easy verse, attuned to every known measure and mood, has since served the whole Orient as an unapproached model. Wassâf and Kâsim-i-Anwâr are likewise to be mentioned. The succeeding century showed the poetical genius of the Persian people at a standstill. It is altogether dominated by the surpassing gifts of Djâmi, the last of Persian poets of the first order. His achievements were assuredly most comprehensive, since they partook of epical, lyrical and mystical literature. He exceeded his immediate forerunners in all these, and he brought the form at least to absolute perfection, his style being throughout most brilliant. But Djâmi was as certainly deficient in creative powers. And after his death, from 1500 on, begins the slow decline of Persian letters. Djâmi's imitators, his son-in-law Hâtifi, Hilâli, Ali of Shiraz, Feisi and Fettâhi, did some clever work; although lacking in initiative. Since 1600 of the men of letters writing in the Persian vernacular, either in Persia or India, who stand out above the average may be cited, among the lyric poets: Tâlib, Sâib, the Emperor Shah-Alâm and Aftâb, the latter's teacher. One leading feature of this later period is the extraordinary wealth in prose fiction, especially collections of fables, fairy and mythical tales, novels and short stories. Most of these had their first home in India and traveled thence, first to the Persians and next to the Arabs, Turks and Koords, whence they finally reached the Occident in versions more or less garbled or emasculated. The collection of fables, published by Husseïn Wâis Kâshifi under the name of 'Enwâr-i-Suheili,' belongs in this category. So do the bright fairy stories of Nakshebi, as well as 'Behâr-i-Danish,' by Inayet Oullâh; the novels of Hâtim Tâi, and the great cycle of novels, 'Bostân-i-Khayâl, in 15 huge tomes. During the 18th century again Ferid Ghafur Khan transcribed the fanciful folklore tales of Hâtim ben Obaid. Another sphere in which Persian literature excels is history. These writings deal in part with the Mohammedan states in general, but likewise with biography, special history and monographs. The habit of using Arabic exclusively as the vehicle of expression when dealing with scientific topics, a habit adopted since the first coming of the Moslem Arab conquerors of Persia, hampered Persian historians for a long time, for many centuries in fact. The first break with this iron-clad custom was made at the instance of Mansûr ben Nuh, in causing a translation of Tabârî's great Arabic work to be made by Bâl'amî, in 963. An excellent work by the famous vizier, Nisâm-ul-Mulk, the 'Siyâset Nameh,' dates from about 1092. Minhâdj ben Sirâdj wrote a huge general history, embracing the time up to 1259, and entitled 'Tabakât-i-Nâssiri,' while Hamdullâh

Mustâfi wrote one in 1329 under the title of 'Tarîsh-i-Guzide.' Reshid ed-Deen of Hamadan published a history of the Mongolian conquerors, the 'Djâmi Uttawârish.' The chronicles of Wassâf also deserve mention, notably because of their florid and highly polished diction. The 'Zafâr Nameh,' being a history of Tamerlane; the 'Rauset Ussefâ,' a universal history couched in rhetorical phrase; the 'Habib Ussiyar' by Khondemir and 'Lûbbuttawârish' by the Ameer Yahia may be named. By the official adoption of the Persian idiom at the courts of the new-established Moslem dynasties in India and of the entire ruling class there, it came about that up to the very conquest of that vast country by the British most, in fact nearly all, historical writing was done there in Persian. Elliott's famous 'History of India as told by its own Historians,' continued by Dawson, gives in a faithful English translation a very good summary of all this. And it is but proper to add here that all these so-called historical works in the Persian tongue are properly classed with literature. For while as a rule they plainly show the defect of the Oriental mind, its horror almost of absolute, bald truth, they give free reign to Oriental imagination and generally welter in poetical description, beautiful pageantry and in admirable strokes of fancy.

PERSIAN MYTHOLOGY. A large number of the Persian myths agree with the earlier and earliest Indian ones and are doubtless drawn from the same prehistoric sources, dating back probably to the days before B.C. 4000. We find in this list the tale of a great ceaseless battle between the Sun God (*Trita, Indra, Iran, Thraetona*) and a colossal, evil

serpent (Ind. *Ahi*, Ir. *Azhi*), a myth embodied and reclothed by Zoroaster in his self-evolved creed. There is also the legend of *Yama*, the first man, now ruler of the dark regions after death; of the "Glorious One" (Iran., *Huvarava*, *Chosrau*, *Chosroes*), the performer of great and useful deeds of valor, a sort of Persian Herakles; of the highest god, the All-Ruler, *Asûra*; of *Mithras*, of the Dragon-Slayer, *Verethraghna*. These earliest mystic and symbolical tales were common to both branches of the Aryan stock, the Indians and Iranians, and have survived all religious and political changes that have occurred in Iran; and so have, up to the Moslem conquest, the fire cult, the veneration of the sacrificial flame, the belief in *soma*, that lifts up man to the gods and fills him with divine strength and fever; the command to conceive pure thoughts and do good deeds; the faith in the efficacy of prayer, incantations, magical power with certain secret formulas, the *manthra* of the early Persians; the submission to fate by gods and men; the service of the *athravan*, priests, mediators, nursers of the flame. All these things have come down from primeval days. But there are unexplained features in all this. No written records tell us of it, but there must have been a long and bitter strife between the two branches—the Iranians and Indians. Only thus can be understood the fact that the old and mutually recognized gods, the *daeua*, became in later days in Iranian eyes "demons" and "evilworkers," while the Indians retained them as beneficent superhuman beings, and that the Iranians called their own gods instead *bhaga*. And that, on the other hand, the Indians dethroned the highest god of the Iranians, *Asûra*, and his subservient helpers, and degraded them to the level of evil spirits and devils. There is, too, at a very early date, plainly perceptible a schism between the two subdivisions north and south of the Indus. Persians, though fanciful yet deep thinkers, were throughout a virile people, bent on practical purposes and enjoying the good things of this earth, while the Indians even in prehistoric times, even before the appearance of their oldest holy books, lapsed into dreamers; their pantheism became negative, even denied the use and purpose of sublunar life itself. Probably climate had much to do with this. In any case this striking contrast must have separated the two races very early and accounts in large measure for the phenomenon of their respective historical development. However, the cycle of myths above referred to, the joint parent possession of the Aryan race, remained firmly fixed in the Persian soul. Zoroaster in molding anew the Persian creed into a purer and more rational one, was a skilful adapter. He retained in somewhat altered shape the ancient sagas and heroes. So did Firdûsi in his legendary history "Shah Nameh," even adding to the list some names that had acquired fame as purely Persian doers of great things, such as Rustem particularly. And the Persians of today still bear these early seeds of faith, this pristine philosophy, in every fibre. Their early mythology breathes in their wonder and fairy tales and in their outlook on spiritual life. Firdûsi's stories of the beginnings of the Per-

sian state, though presented with a naïve appearance of truth, are wholly unwarranted, however. He tells of the overthrow of a mythical personage, King Afrasiab, by the national hero, Rustem. As a matter of fact, though, history in Persia started with their migration from India.

PERSIGNY, pĕr-sĕn-yĕ, Jean Gilbert Victor Fialin, Duc DE, French statesman: b. Saint-Germain-l'Espinaise, department of the Loire, 11 Jan. 1808; d. Nice, 13 Jan. 1872. Having entered the cavalry division of the army he took part in a movement among a section of the troops in favor of the revolution of July (1830) and was expelled from the service on the charge of insubordination. He then went to Paris and took up journalism, became an intimate friend of Louis Napoleon, and an active disseminator of Bonapartist propaganda. He was the instigator of the military rising at Strassburg in 1836, was arrested, but managed to escape; and in 1840 shared in the expedition to Boulogne, when he was again captured; and on this occasion condemned to 20 years' confinement, but his captivity ultimately resulted in little more than restriction to the town of Versailles. During this period he wrote and published 'Memoire de l'Utilité des Pyramides de l'Egypte' (1845). On the outbreak of the revolution of February 1848 he hastened to Paris, brought about an agreement between the members of the Napoleon family, collected their adherents, traveled over France on their behalf and in various other ways largely contributed to determine the vote by which Louis Napoleon was elected President of the republic, on 10 Dec. 1849. He was also one of the most prominent actors in the *coup d'état* of 2 Dec. 1851. In January 1852 he was nominated Minister of the Interior, and in this capacity signed the decrees relative to the confiscation of the Orleans estates, and directing the first elections to the *corps législatif*. In 1855 he went as Ambassador to London. In 1860 he was again made Minister of the Interior, but in 1863 was compelled to resign because of his attempted arbitrary control of the press. He was elevated to the rank of duke in 1863, and thereafter held the position of Senator until the fall of the empire. Consult d'Espagny, Count, 'Memoires du Duc de Persigny' (Paris 1896); Delarva, 'Le Duc de Persigny et les Doctrines de l'Empire' (1865).

PERSIMMON, or DATE-PLUM. These names are given to each of several trees and shrubs of the family *Ebenaceæ*. Like other members of their genus (*Diospyros*), of which there are about 200 mostly tropical species, these have deciduous or persistent entire leaves,

diæcious or polygamous, whitish or yellowish flowers in axillary cymes, followed by large juicy fruits (berries) containing from one to 10 flat seeds. The best known species in America is the common or American persimmon (*D. virginiana*), which often reaches 50 feet in height and sometimes 100 feet, with a spreading, round-topped head and frequently drooping branches. It is found from Connecticut to Indiana and southward to the Gulf States. The plum-like fruits, to which the calyx is adherent, are usually about an inch in diameter, yellow with a pink cheek on the sunny side, and of variable flavor. Contrary to popular belief, they are not always astringent until frozen, nor does freezing make all persimmons edible. There are wild varieties which ripen in early autumn before frost, and others which continue unpalatable in spite of frost and sun. The tree will thrive as far north as southern Michigan and western New York. Though there are numerous native seedlings which bear good fruit, yet even in its most favored districts the tree has attracted little horticultural attention. Like other members of the genus, notably *D. ebenum*, which yields ebony, this species furnishes a hardwood useful for interior finish of houses, but ill adapted to resist moisture. Propagation is readily effected by means of seeds stratified out of doors during the winter and planted like peach-pits in the spring. Since they are exceedingly variable, they are usually grafted or budded when two years old, in early spring, with desirable varieties. Unless transplanted when very small, they are likely to fail because of their long tap-roots. Autumn transplanting is preferred, the top being cut back severely, but the roots retained as much as possible. The trees succeed best upon well-drained, rich, loamy soil well exposed to the sun.

The Japanese persimmon or kaki (*D. kaki*) is a smaller species than the American, rarely exceeding 40 feet in height, some varieties being under 10 feet. It is a native of Japan, China and Korea, where it is one of the leading cultivated fruits. During the closing quarter of the 19th century it was successfully cultivated in the Southern States, and is making its way as a dessert fruit in Northern markets. The fruits, which often resemble tomatoes in appearance, are several times larger than the native species. Some of them resemble apricots in flavor. They have been successfully cultivated in the Atlantic States as far north as Virginia; in the Gulf States and in California. Usually they are propagated by budding or grafting upon seedling stocks of the American species, like which they are cultivated.

Two other species are cultivated for their small black fruits: *D. lotus*, an Asiatic species, in China, Japan and Korea, and *D. texana*, in Texas and Mexico, where it is indigenous.

The persimmon is fairly free from insects, few of which are troublesome. The chewing species, such as caterpillars, can be controlled by arsenites; the sucking species, such as plant-lice and flea-lice, by kerosene emulsion. (See INSECTICIDE). Consult Watts, 'Persimmons,' Tennessee Agricultural Experiment Station Bulletin XI, No. 1; Hadley and Troop, 'The American Persimmon,' Indiana Agricultural

Experiment Station Bulletin, No. 60; Bailey, 'Standard Cyclopaedia of Horticulture.'

PERSIUS FLACCUS, pēr'shī-ūs, flāk'ūs, Aulus, Roman satirist; b. Volaterræ, Etruria, 34 A.D.; d. Rome, 62 A.D. He was a pupil of the grammarian Virginius Flavius, probably also of Remmius Palaemon, but more important than all of the Stoic Cornutus, whom he celebrated in his verse, and whose teachings he proclaimed and expounded. In Pætus Thrasea, the famous senator and lofty Stoic, he found a patron and close companion. His earlier poetic ventures he burned. But he left six satires, containing only between 600 and 700 lines, which, retouched by Cornutus, were published in a booklet by Cæsius Bassus, a fellow poet. These works won immediate and high reputation. Apparently the obscurity which had become felt as far back as Jerome, and made him "the paradise of commentators," was not sufficient to disturb contemporaries. This unintelligibility seems to be the result of an effort to condense into phrases more meaning than they may clearly bear. Whether or not this is a literary trick has been debated; but such certainly is its effect. Within a limited field Persius evinces keen insight, descriptive gift, and dramatic power. At times he gives interesting glimpses of his studious life, and his devotion to the noble interests of his philosophy. He was a persistent, though none too successful, imitator of Horace, playing generally unsatisfactory changes upon some 100 various lines of the earlier poet. He was seriously in earnest and practically devoid of humor. Many of his pointed expressions have passed into the store of literary quotation. There are editions by Orelli (1833); Hauthol (1837); Jahn (1843; rev. by Bücheler 1886); and, with excellent notes, by Gildersleeve (1875). Conington made a prose rendering into English (1874). Consult also Knickenberg, F. A., 'De Ratione Stoica in Persio' (Marburg 1869).

PERSONAL EQUATION. See EQUATION, PERSONAL.

PERSONAL LIBERTY LAWS, in American history, a general name applied to those statutes passed by the Northern States to protect the negroes within their borders, who had escaped from slavery in the South. They were passed by the States as a protest against the Federal support of the capture of fugitive negroes in the free country of the North. The first acts were passed about 1840, though Indiana and Connecticut had previously provided that fugitives might have a trial by jury. The Fugitive Slave Law (q.v.) of 1850 aroused the most violent opposition in the North, and before 1856 many of the States had passed personal liberty acts. Beside prohibiting the use of State jails these laws forbade State judges and officers to assist claimants or issue writs. Trial was to be given all alleged fugitives. Heavy penalties were provided for the violation of these laws. Such acts were passed in Vermont, Connecticut, Rhode Island, Massachusetts, Michigan, Maine, Wisconsin, Kansas, Ohio and Pennsylvania. Several of the other Northern States, while refraining from passing laws which virtually were in direct opposition to the Federal laws, imposed such restrictions in the administration that all attempts to enforce its provisions were seriously hampered.

Among these obstructionist States were Illinois, Indiana, Iowa and New Hampshire. Of the Northern States, New Jersey and California alone sanctioned the rendition of fugitives. See SLAVERY.

PERSONAL PROPERTY. See PROPERTY.

PERSONALITY, Disorders of. There are certain interesting pathological states of the mind in which the unity of the individual is lost or disordered. In many forms of insanity the whole nature of the patient is altered, and he may have the hallucination that he has become some inanimate object, or that he has lost his soul, or that he has undergone some other profound change of personality. This is due to the fact that the unity and character of consciousness are largely determined by the organic background which underlies all experiences, so that when this changes the continuity with the former self is likely to be lost. However, in these pathological states the continuity of consciousness does not suffer the brusque disruption characteristic of certain mental anomalies which are more definitely disorders of personality. In extreme cases we may find what to all appearances are two or more selves alternating in one body. These may differ in character, in tastes and in their entire stock of experiences; each may feel the rest as intruders in the common body. On the other hand, there may be a greater or less degree of community between the different selves; one may have a partial memory of the experiences of another. Furthermore, the separate selves may coexist, as in the case where an anæsthetic hand exhibits a power of writing things unknown to its possessor. The selves coexisting with the normal self may or may not also have an independent existence and may or may not possess a considerable measure of unification into clean-cut personalities. The "automatism phenomena," as such manifestations as the writing of an anæsthetic hand are called, may be evoked in normal individuals by means of various modes of suggestion. Alternation of personality is always pathological in nature and is usually due to some shock, mental or physical, in nature, which shatters the personality and causes some of the resulting fragmentary groups of ideas to assume an existence on their own account. According to Freud this shock is generally of a sexual nature, which causes certain experiences to be suppressed, and to assume a consequent individuality of their own. Consult Binet, A., 'Alterations of Personality' (New York 1910); Prince, M., 'The Dissociation of a Personality' (New York 1910); Ribot, T., 'The Diseases of Personality' (tr., Chicago 1906); Sidis and Goodhart, 'Multiple Personality' (New York 1905).

PERSONATION. See CORRUPT PRACTICES ACTS.

PERSONIFICATION, the representation of things inanimate or of abstract ideas as living things or persons. This is a familiar practice in all the arts; thus we have the statue of liberty and the familiar 'My Country 'Tis of Thee,' both of them implying the personification of an idea which has no real human attributes. Fine examples of personification in poetry are the 'Passions' of Collins and the odes of Gray. Michelangelo's statues of 'Night' and 'Morn-

ing'; Guido Reni's 'Dawn'; Titian's 'Beauty, Sacred and Profane' are noble examples of personification in art.

PERSONS TO BE INCORPORATED. See CORPORATIONS, LEGAL.

PERSPECTIVE, Linear. Most people have observed that objects diminish in size as they recede farther and farther from the eye; that parallel lines appear to converge; that in general the appearance of objects differs from the reality. But if we are asked why the appearance differs from the truth, or what the precise appearance must be when the true dimensions and position of the object are known we cannot answer offhand. These must be determined by the principles of *Perspective*.

Perspective Defined.— *Perspective* is the science and art of representing on a plane surface the appearance of objects according to optical and mathematical principles. In order that the representation of an object may be complete we must represent its correct outline, its proper light and shade and the apparent color. These requirements give rise to two branches of the subject, namely, *Aërial Perspective* and *Linear Perspective*.

Aërial Perspective deals with the appearance of objects as affected by the air, light and shade and color. But as its principles are not yet fully established, we shall devote our attention in this article mainly to *Linear Perspective*, the exact science, which deals with outline alone. It will teach us the laws governing the apparent position, direction and length of the edges or outlines of objects. We shall first review the principles of the subject and then take up a few practical problems.

1. THE BASIC THEORY OF PERSPECTIVE.

Theory of Perspective Illustrated.— If while standing before a closed window you traced on the glass the outline of an object beyond, seen through it, you drew on the glass a true *picture* or *perspective view* of that object. What took place in this process of tracing? From every visible point of the object there emanated a ray of light termed a *visual ray*, which pierced the glass and entered the eye. The outline you marked was the aggregate of points through which the rays of light from the object pierced the glass. This is graphically illustrated in Fig. 1.

Let *S. P.* in Fig. 1 be the eye of the spectator, *B A P L* a pane of glass standing on its edge *P L*, and *T*, a triangle behind the glass. From *a b* and *c* draw lines to *S. P.*; on the plane *B A P L* mark the points *a', b', c'*, and connect; then *T'*, drawn on the glass, will be a

perspective view of the triangle as seen by the eye at *S.P.* It is evident then that the whole problem of perspective is,—given a pyramid of light, its base at the various points of the object and its apex at the eye; required to determine the section on a plane cutting the pyramid somewhere between the base and the apex.

The Problem of Perspective Formulated.

—The vast majority of objects have their prototypes in the geometric solids—the cube, prism, pyramid, cylinder, etc. Hence in all demonstrations on the theory of perspective, these are used as models. Again, all solids are bounded by plane surfaces; all surfaces are limited by lines; and a line is a consecutive series of points. It is obvious, therefore, that before we can successfully construct the perspective of any solid we must know how to determine the perspective of a given point. Let us then assume a point and try to find its perspective. Our problem will read: Given a ray of light emanating from a point on one side of the vertical plane, and traveling to the eye on the other side of the plane; required to find the point at which that ray will pierce the plane. Before solving the problem we must get a clear idea of the terms, conventions and basic principles of the science.

Terms and Conventions used in Perspective.—In this subject four planes are employed: (1) *The Picture Plane (P.P., Fig. 2)*, an imaginary plane placed in front of the spectator, on which the objects are drawn; (2) *The Ground Plane (G.P.)*, a horizontal plane on which the spectator and the objects viewed are supposed to stand. The intersection of the first and second plane is called the *Ground Line (G.L.)*, or *Base of the Picture*; (3) *The Horizontal Plane (H.P.)*, a plane passing horizontally through the eye of the observer, and cutting the Picture Plane at right angles in the line *H. L.*, called the *Horizon Line*, or simply the *Horizon*; (4) *The Central Plane (C.P.)*, a plane passing vertically through the eye of the observer, and cutting each of the other planes in a right angle.

The position of the eye is fixed by its distance from the ground plane, its distance in front of and from the left-hand or right-hand limit of the picture plane.

The height of the eye is the distance of the eye above the ground.

The Centre of Vision (C.V.) is the point on the picture plane which is directly opposite the observer's eye. (Fig. 3).

The Station Point (S.P.) is the point in space at which the eye is held.

The Distance of the Eye is the distance from the station point to the centre of vision.

The Prime Vertical is a vertical line on the picture plane passing from the centre of vision to the ground line. It is of course directly opposite the spectator.

The Distance Points (D^R and D^L) are the distance of the eye (S.P.—C.V.) laid off on the horizon, to the right (D^R), and to the left (D^L) of the centre of vision.

The Perspective of a Line is the sum of the perspectives of all its points.

The Vanishing Point of an indefinitely long line is the perspective of that one of its points which is farthest from the picture plane.

The Fundamental Rules of Perspective.—The basic rules upon which the whole science of perspective rests are:

Rule I.—When a line is parallel to the picture plane, its perspective will be parallel to the line itself. This may be proved as follows:

FIG. 4.

Given the line *X Y* in space, parallel to the picture plane *P.P.* (Fig. 4), and *S.P.*, the eye. Through *X Y* pass a plane *R.R* parallel to the Picture Plane. Connect *X Y* with *S.P.* The plane of the triangle *X.S.P.Y.* is cut by two planes *P.P.* and *R.R.*, parallel to each other.

FIG. 2.

FIG. 3.

Hence the lines of intersection on these planes XY and $X'Y'$ are parallel to each other, that is, the perspective of the line is parallel to the line itself. From Rule I we also deduce: (1) That when a horizontal line is parallel to the picture plane, its perspective is parallel to the horizontal line. (2) That a vertical line appears vertical in perspective. (3) That any surface parallel to the picture plane is represented in perspective by a surface, similar but smaller.

Rule II.—When a line is inclined to the picture plane, its vanishing point may be found by drawing from the eye a visual ray, parallel to the line, and noting where this ray pierces the picture plane. This may be proved as follows:

FIG. 5.

Given the line OT (Fig. 5), inclined to the $P.P.$, and extending from its intersection with the picture plane at O , to infinity. The perspective of any point of this line is found by drawing a ray from the eye to that point and noting where that ray cuts the picture plane. Assume the points 1, 2, 3, 4, on the given line, receding successively from the picture plane. It will be seen that the farther the point assumed is from the picture plane, the more

FIG. 6.

nearly does the visual ray to that point become parallel to the given line. And if the point T be assumed at an infinite distance from the picture plane, the ray to that point will be parallel to the line OT . Hence the vanishing point of the line OT is found by drawing from the eye a ray parallel to the given line, and noting where it pierces the picture plane.

From Rule II we deduce: (1) That all parallel lines with the exception of lines parallel to the picture plane, converge to, or vanish in, the same point. (2) That horizontal parallel lines with the exception of lines parallel to the picture plane vanish in a point on the horizon line. (3) That lines perpendicular to the picture plane vanish in the centre of vision. (4) That horizontal lines 45° to the picture plane vanish either in DL or DL .

Problem I.—To determine the perspective of a line perpendicular to the picture plane and receding from the picture plane to infinity.

To find the perspective of any line, we need but find the perspective of two of its points, say the beginning and the end of the line, and connect. Let OT be the line (Fig. 6), O being the initial point in $P.P.$, and T , a point at infinity. O being in the $P.P.$, is its own perspective; T being the infinitely distant end of a line perpendicular to $P.P.$ has its perspective at $C.V.$ (Rule II, Deduction 3). Connecting these two points in the picture plane, we get $O-C.V.$, the perspective sought.

In Fig 6 we assume the ground plane perpendicular to the picture plane. If we are to represent all this on a flat surface, we must turn the planes in such a manner that they form one continuous surface. This is accomplished by turning both front and rear parts of the ground plane downward, till they lie on the same plane as the picture plane; and viewed from the front, or simply as a picture plane, the work in Fig. 6 assumes the appearance shown in Fig. 7.

Problem II.—To determine the perspective of a horizontal line 45° to the picture plane and receding to infinity.

Let MN (Fig. 8) be the line lying on the ground, M the initial point in $P.P.$, and N , a point at infinity. M is its own perspective. T will vanish in DL if the line makes an angle of 45° toward the left, with the $P.P.$ (Rule II, Deduction 4). Connecting M with DL , we obtain the line $M-DL$, the perspective sought. Revolving the planes as in Problem I, we get Fig. 9.

FIG. 7.

We can now proceed to find the perspective of a given point, which we set out to do at the beginning.

Problem III.—To determine the perspective of a point.

Let X be the point (Fig. 10). Pass through it a line OT , perpendicular to the picture plane. Its perspective will be $O-C.V.$ (Prob. I).

Somewhere on this line will be the perspective of X . Through the same point X pass another line $M-N$, horizontal and at 45° to the picture plane, left or right called a *diagonal*. If the angle is toward the left, its perspective will be $M-D^L$. The perspective of X will be somewhere on this line too. Being both on $O-C.V.$ and on $M-D^L$, the perspective of X must be at the intersection of the two, namely at X' . Revolving the ground plane downwards we obtain Fig. 11.

FIG. 8.

Rule III.—Hence, to find the perspective of any point, pass through that point a perpendicular and a diagonal to the P.P.; at the intersection of their perspectives will be the perspective of the point.

II. THE PRACTICE OF PERSPECTIVE.

Before taking up the solution of practical problems, it would be well to know how to find the plan and elevation of an object, and to understand drawing to scale.

The Plan and Elevation of Objects.—Let

FIG. 10.

us take a square prism for illustration. In Fig. 12, in which both planes are assumed transparent, let the square prism be placed so as to rest on one of its square bases on the G.P., some distance back of the P.P. If lines be drawn around the edges of the prism where it touches to G.P., we shall obtain what is called the *horizontal projection* or *plan* of the prism. And if we draw perpendiculars from every point of the prism to the P.P., and connect points $ac-bd-AC-BD$, we shall get on the picture plane the *vertical projection* or *elevation* of the

prism. Removing the prism and revolving the G.P. downward, we obtain Fig 13. Frequently the plan and elevation of an object have to be drawn before the perspective of that object can be determined.

Drawing to Scale.—Objects to be rendered in perspective are generally so large that their real dimensions cannot be shown in a drawing; hence in such cases, the drawing is made a certain number of times smaller than the real object. The relative proportion between the

FIG. 9.

drawing and the real size of the object to be represented is called a *scale*. For example, if an object is 12 feet high, and the drawing is made three inches high, the scale is one-forty-eighth, or one-quarter inch to the foot. But to avoid confusion, we shall in the following demonstrations designate and render the size and position of objects in terms of *units of measure*. A unit of measure may stand for a foot, an inch, or any part of an inch, according to the scale used.

FIG. 11.

Divisions of Perspective.—For convenience, linear perspective is divided into three parts, namely, *parallel*, *angular* and *oblique perspective*, depending on the position of the object with reference to the P.P. and the G.P.

Parallel Perspective or One-Point Perspective refers to that position of the object which makes use of only one vanishing point (C.V.), and the two distance points (D^L and D^R). Hence it is applied to the drawing of all rectangular objects when so situated that all their faces are either parallel with or at right angles

to the *P.P.* A few problems in Parallel Perspective will now be solved. The instruments and materials necessary are: a drawing board, a T square, two triangles (30° and 60°), a protractor, paper, a 2H leadpencil, a compass, a

of the line. Through point 3 draw a diagonal to *G.L.*, touching the *G.L.* at 4. Draw $4-D^L$. Point 5, where $4-D^L$ crosses $2-C.V.$ will be the perspective of the lower end of the line (Rule III). At 5, erect a vertical line until it touches

FIG. 12.

FIG. 13.

ruling pen, a ruling scale and Higgins' India ink.

Problem IV.—Put into perspective a vertical straight line 3 units high, when the lower end rests on the *G.P.*, 3 units to *L.* of *S.* (left of *Spectator*), and 1 unit within.

Assume the *H.L.* 2 units above the *G.L.*; and the distance of the eye $4\frac{1}{2}$ units (Plate I).

1-*C.V.* at 6, which is the perspective of the upper end of the line. Strengthen 5-6, the perspective of the given line.

Problem V.—Draw a horizontal square plane of 2 units edge, lying on the *G.P.* with 2 of its edges parallel with the *P.P.* and its right front corner $\frac{1}{2}$ unit to *R.* of *S.*, and $\frac{1}{2}$ unit within.

PLATE I.

From *S* mark off on the *G.L.* the point 1, three units to the left, and draw 1-2, the vertical projection or elevation of the line. Draw 1-*C.V.* and 2-*C.V.* One unit below the *G.L.*, mark point 3, the horizontal projection or plan

Mark off on the *G.L.* point 7, one-half unit to the right of *S*, and point 8, $1\frac{1}{2}$ units to the left of *S*. Line 7-8 will be the vertical projection of the square. Draw 7-*C.V.* and 8-*C.V.* One-half unit below the *G.L.*, draw the square 9-10-

11-12, the horizontal projection. Through points 9-12, draw a diagonal, touching the *G.L.* at 13. Draw 13-*D^L*, cutting the line 7-*C.V.* at 14, and the line 8-*C.V.* at 16. Construct lines 16-17 and 14-15, parallel to *G.L.* The figure 14-15-16-17 will be the desired perspective of the square. In many problems we can dispense with the plan entirely. In the last problem, for instance, knowing that the square is one-half unit behind the *P.P.*, we might have measured off directly on the *G.L.* the point 13, one-half unit to the right of point 7, without the aid of the plan and diagonal 12-9. The method of finding the perspectives in Problems VI and VII is evident, and requires no explanation.

Problem VIII.—Draw the perspective of a pavement of squares of 1 unit edge, two of the sides of the squares being parallel to the Ground Line.

Assume the *H.L.* $2\frac{1}{2}$ units above the *G.L.*; and the distance of the eye $4\frac{1}{2}$ units (Plate II).

The squares having two of their sides par-

pendiculars cutting the lines 3-*C.V.* and 4-*C.V.*, at points 10, 11, 12 and 13. Connect 10 with 11, and 12 with 13. Make line 7-8, 8-9 and 8-12 dotted. The figure 6-7-8-9-10-11 is the perspective of the given cube.

Problem X.—Draw the perspective of a wooden cross, 1 unit in section, the long beam being 4 units long, and the short one 3 units. The distance from the lower end of the long beam to the under side of the cross beam is 2 units. The cross is standing on the lower end of the long beam with the square end of the cross beam in the *P.P.* The extreme right corner of the square end is $3\frac{1}{4}$ units to *R.* of *S.*

Draw the elevation 1-2-3-4. From points 1, 2, 3, 4, 5, 6, 7 and 8 draw lines to *C.V.* The square end 5-6-7-8, being in the *P.P.* is its own perspective. To the left of 1, mark off points *a*, *b*, *c* one unit apart; connect these with *D^R*. At points 9, 10, 11, 12, 19 erect perpendiculars, limited by the lines running to *C.V.* Accent the visible lines.

allel to the *G.L.* their other two sides will be perpendicular to the *P.P.* and will therefore vanish in *C.V.* *D^L* and *D^R* will be the vanishing points of the diagonals. Mark off on the *G.L.* at 1, 2, 3, 4, etc., distances of one unit each. Through these draw to *C.V.*, lines which are the perspectives of the sides of the squares, perpendicular to the picture, intersect these by a diagonal drawn from any point, as 8, to *D^L*; and through the points of intersection, draw lines parallel to the *G.L.*

Problem IX.—Put into perspective a cube of $1\frac{3}{4}$ units edge, standing on the *G.P.* with the front face parallel to the *P.P.* and its right lower corner $1\frac{3}{4}$ units to the left of *S.*, and one-half unit within.

Construct the elevation, 1-2-3-4 (Plate III, Prob. IX), and draw the lines 1-*C.V.*, 2-*C.V.*, 3-*C.V.* and 4-*C.V.* on the *G.L.* mark off point 5, $\frac{1}{2}$ unit to the left of point 1. Draw the line 5-*D^L*, cutting, 1-*C.V.* and 2-*C.V.* in points 6 and 8, respectively. Through points 6 and 8 draw the lines 6-7 and 8-9, parallel to the *G.L.* The resulting figures, 6-7-8-9, will be the base of the cube. On points 6, 7, 8 and 9 erect

In the perspective of the bridge (Prob. XI) one new element enters which requires explanation—the rendering of the semi-circular arch. The method of construction is as shown on Plate IV.

To the left of line 1-2, and at a distance from the *G.P.* equal to that of the arch, construct the square 3-4-5-6 of $1\frac{1}{2}$ units edge; in this inscribe the quadrant 3-4-5. Draw the diagonal 3-6, cutting the quadrant at point 7; through this point draw a line parallel to 5-6. Connect points 6, 8 and 4 with *C.V.* In the proper place construct the half square 9-10-11-12; and from point 13 draw the lines 10-13, 11-13, cutting the line 8-*C.V.*, at points 15 and 16. The curve connecting points 9, 15, 14, 16 and 12, will be the required perspective of the arch.

We are now ready to consider the second division of perspective, namely,

Angular Perspective.—This branch of perspective is applied to the drawing of all rectangular objects that make angles other than right angles with the picture plane. Hence it makes use of two vanishing points, both on

the horizontal line. For this reason it is sometimes called *Two-Point Perspective*.

Problem XII.—Making a perspective drawing of a cube of $1\frac{1}{2}$ units edge, resting on the G.P., with its horizontal edges vanishing to the right at 60° , and to the left at 30° with the P.P.

left, at S.P., make an angle of 30° , and continue the line until it touches the H.L. at V.P. 30° . All lines in the model inclined 30° to the P.P. will vanish at this point.

Every vanishing point must have a measuring point (M.P.) for all lines that vanish at

[PLATE III.]

The nearest corner on the ground being 1 unit to R. of S., and $\frac{1}{2}$ unit within. See Plate V.

Assume the H.L., G.L. and S.P. (station point). At S.P. to the right, make an angle of 60° with the line D.L. (directing line), and continue the line forming the angle until it touches H.L. at V.P. 60° . All lines in the cube 60° to the P.P. will vanish at this point. To the

it. To find the M.P. for V.P. 60° , lay-off on the H.L. the distance from V.P. 60° to S.P. Similarly find the M.P. for V.P. 30° .

On the G.L. mark off point 1, 1 unit to R. of S. and 2, $\frac{1}{2}$ unit to the right of 1. Draw 1-C.V., and 2-D^L, intersecting at 3, the nearest point of the cube on the ground. Draw 3-V.P. 30° and 3-V.P. 60° . From M.P. 30° draw a line

PLATE IV.

through 3, touching *G.L.* at 7. Mark off $1\frac{1}{2}$ units to the left of 7, giving us point 8, and draw $8-M.P.30^\circ$, cutting $3-V.P.30^\circ$ at 9. From $M.P.60^\circ$ draw a line through 3, touching the *G.L.* at 4. From 4 mark off on *G.L.* $1\frac{1}{2}$ units to the right at 5, and draw $5-M.P.60^\circ$, cutting $3-V.P.60^\circ$ at 6. Draw $9-V.P.60^\circ$ and $6-V.P.30^\circ$, intersecting at 10, the rear corner of the cube. Prolong $3-V.P.60^\circ$, touching the *G.L.* at 11. On 11 erect a perpendicular 11-12, $1\frac{1}{2}$ units high, and connect 12 and $V.P.60^\circ$. On 3 erect a perpendicular, touching $12-V.P.60^\circ$ at 14, and one on 9, touching $13-V.P.30^\circ$ at 15. Draw $15-V.P.60^\circ$ and $14-V.P.30^\circ$, intersecting at 16. Construct the perpendicular 10-16, completing the cube. Make lines 9-10, 10-16 and 10-6 dotted, and accent the others.

The third division of perspective known as *Oblique Perspective* or *Three-Point Perspective* refers to that position of rectangular objects in which there are three systems of vanishing lines. It is applied to the representation of

dering of architectural subjects as dwelling-houses, mansions, public libraries, churches, railway stations and theatres in linear perspective. It is customary for an architect to express his ideas for a proposed building in two distinct ways. At first he produces a series of working-drawings, consisting of plans, elevations and sections of the structure, drawn to a proper scale, and conveying precisely the information necessary for the builders. But the plans and elevations represent in each case only two dimensions and do not exhibit the natural aspect of the structure from a given point of view. Hence, to supply the deficiency, he also renders his designs in linear perspective.

History of Perspective.—A thorough study of the plastic and graphic arts of the ancient Egyptians and Assyrians reveals the fact that they were absolutely ignorant of all the branches of perspective. The Greeks understood sculptural perspective, but knew nothing of the linear and aerial phases of the subject.

PLATE V.

lines that make angles other than right angles with the *G.P.* and the *P.P.*; for example, in gable edges of house roofs. The work is too complicated and advanced to be taken up here.

Perspective, Sculptural.—Owing to the action of aerial and linear perspective, statues and reliefs designed for positions high above the eye-level naturally appear changed in size, form and degree of distinctness, when viewed from below. For instance, a figure, which looks tall and graceful at the eye-level will appear short and squat above the eye, and a subject, modeled in very low relief, will be vague and indistinct in an elevated position. Therefore, when the sculptor models a statue for a position on the façade or spire of a church, he deliberately exaggerates the proportions and forms of his subject in such a manner that they will appear natural when viewed from the ground. This forms a special study, known as *sculptural perspective*. The ancient Greeks understood it and used it to advantage in the pediments and metopes of their temples. The works of Donatello, Michelangelo and Rodin also show mastery of this form of perspective.

Architectural Perspective refers to the ren-

dering of architectural subjects as dwelling-houses, mansions, public libraries, churches, railway stations and theatres in linear perspective. Thus in some of the frescoes at Pompeii we find positive attempts at rendering buildings in perspective, although with little success.

The honor of having been the first to solve the problem of linear perspective rests with the Florentine realistic painter, Paolo Ucello (1397-1475). Its application in his fresco 'The Flood' in the church of Saint Maria Novella at Florence is quite successful. Following his example, the subject was attacked with enthusiasm by his contemporaries, especially by the architects Filippo Brunelleschi and Leo Battista degli Alberti who formulated and wrote down the principles of the science. Alberti's treatise, 'De Pictura Libri tres,' formed the textbook on the subject for generations of artists, and is even to-day quite readable.

It was the Dutch and Flemish schools of painting that first introduced aerial perspective in their pictures, as may be seen in the interiors of Pieter de Hooche, in the architectural paintings of Van der Heyden, in the landscapes of Hobbema and in the figure pieces of Rembrandt. Later it was adopted by the Italian,

Spanish, English and French schools. The artists of modern times who have especially distinguished themselves as masters of aerial perspective are Corot, Daubigny, Mauve, Israels, Maris and Monet.

Bibliography.—There are very many excellent treatises on perspective by American, English, French and German authorities. The most important are Maillard de la Gournerie, J. A. R., 'Traité de perspective linéaire' (Paris 1898); Lawrence, W. H., 'Principles of Architectural Perspective' (2d ed., Boston 1904); Pratt, Robert, 'Perspective Including the Projection of Shadows and Reflections' (New York 1901); Seeberger, Gustav, 'Principien der Perspektive' (7th ed., Munich 1900); Spanton, J. H., 'Complete Perspective Course' (London 1900); Storey, G. A., 'The Theory and Practice of Perspective' (Oxford 1910); Ware, W. R., 'Modern Perspective' (rev. ed., New York 1905).

A. G. SCHULMAN,

Department of Art, College of the City of New York.

PERSPIRATION, or SWEAT, the fluid secretion of the sudoriferous glands (sweat-glands) of the skin. The term perspiration is, however, sometimes used to include all the secretions of the skin, such as those of the sebaceous glands or follicles, etc. The sweat consists of part of the watery constituents of the blood, separated therefrom by the sweat-glands and eliminated on the surface of the skin in drops of fluid. The sweat-secretion, in ordinary circumstances, is evaporated from off the skin as fast as it appears. But after violent exercise, when the body is exposed to a great heat, or in certain diseases, the perspiration may collect in greater quantity and appear in the form of visible drops of fluid. The sweat-glands are situated in the subcutaneous adipose or fat-tissue of the skin. Each consists of a coiled-up tube, forming a glandular structure, which is invested by a capillary net-work of blood-vessels. The tube is continued in a somewhat wavy course upward through the cutis or true skin. When it enters the epidermis it becomes spiral and it continues to ascend through this superficial layer of the skin in a tortuous course till it opens on the surface in an oblique aperture. The duct is lined by epithelial cells, continuous with those of the epidermis itself. The openings of the sweat-ducts are the pores of the skin. The largest and most numerous ducts are situated in the armpit. The palm of the hand is also well supplied. Their number in this situation has been estimated by different authorities at from 2,736 to 3,528 to the square inch. The sole of the foot is also abundantly supplied; and these ducts and glands occur, in less numbers and of smaller size, over the entire body surface. In the neck and back they number only about 417 to the square inch and the entire number in the body is estimated at 2,381,428. If placed together the openings of the entire sweat-glands would form, it is calculated, an evaporating surface of about eight square inches; that is, reckoning each orifice or sweat-pore to present a diameter of one fifty-sixth of a line. The line, as Krause estimates it, is equal to one-tenth of an inch.

The insensible perspiration of the skin is a term used by physiologists to denote the mat-

ters evaporated from the skin, and which are thus continually being got rid of without being noticed. When the sweat collects in drops on the skin-surface it is termed sensible perspiration. The primary factor determining the amount of sweat excreted is nervous dilatation of the blood-vessels; heat, etc., are only secondary factors. In this respect the skin is unlike the kidneys.

The analysis of sweat has always formed a matter of dispute, chiefly from the difficulty of obtaining the secretion in sufficient quantity to make an exact estimate of its compounds. In ordinary sweat, water, carbonic acid and sebaceous matter may be assumed to be the chief constituents. Thenard, analyzing the sweat obtained from a flannel shirt washed in distilled water, found chloride of sodium, acetic acid, phosphate of soda, phosphate of lime, traces of oxide of iron and an animal substance. Berzelius obtained chloride of sodium, chloride of ammonium and lactic acid in sweat from the forehead. Anselmino, in the sweat collected from his own arm placed in a glass cylinder, found water, carbonic acid and acetate of ammonia; and from the dried residue or ashes of sweat he obtained soda, in the form of the sulphate, phosphate, and carbonate, potash, chloride of sodium; phosphate and carbonate of lime; and oxide of iron (traces). A certain amount of urea is generally regarded as a normal constituent of sweat-fluid. Gorup-Besanez says that the general and ordinary composition of perspiration is included under the list of water, fat, urea, acetic, butyric and formic acid and salts—the latter being chlorides of sodium and potassium, earthly phosphates and sulphates, together with oxide of iron.

The quantity of sweat evolved from the skin varies according to temperature and exertion from a small value to more than two pounds an hour. The carbonic acid got rid of by the skin is calculated to amount to about one-fiftieth of that exhaled by the lungs, this calculation applying to warm-blooded animals only. In amphibians (frogs, etc.), in which the skin plays a more important part in respiration, the amount of carbonic acid exhaled is much greater than that above stated to occur in warm-blooded animals. A frog, the lungs of which had been cut out, generated by its skin one-quarter cubic inch of carbonic acid in eight hours. The amount of watery vapor secreted by the skin has been roughly calculated to amount to double of that exhaled by the lungs in the same or during any given time. The entire subject of transpiration by the skin shows how very closely connected is that function with respiration and excretion by the kidneys. The skin of man eliminates about as much water as the kidneys, but much less solid matter. Perspiration is essentially not an excretory, but a heat-regulating function. See RESPIRATION; SKIN.

PERTH, Canada, county-seat of Lanark County, Ontario, situated on the Tay, and the Canadian Pacific Railway, 50 miles southwest of Ottawa. It contains a public library, collegiate institute and fine municipal buildings. There are also foundries, machine shops, sash and door factories, mineral water works, felt and carpet factories, knitting mills, boot and shoe factories, etc. Pop. 3,588.

PERTH, Scotland, city, capital of the county of the same name, and a great railway junction on the right bank of the Tay, here crossed by an elegant bridge of nine arches, a steel girder bridge (1900) and a railway bridge, 43 miles north-northwest of Edinburgh.

The town is laid out with considerable regularity, and contains several spacious streets, handsome terraces and crescents. The public buildings include the municipal building, a handsome edifice in the Tudor style; the county building, an elegant Grecian structure facing the Tay; the penitentiary or general prison, the city and county infirmary, the Royal Lunatic Asylum, finely situated on the north side of Kinnoull Hill; the public hall, in the Scottish baronial style; the handsome new post office; the Academy; Sharp's Educational Institution and various other schools; the attractive building of the Antiquarian Society, called Marshall's Monument, which contains a public library in addition to the museum of the Society; the Sandeman Public Library; the railway station, one of the finest in Scotland, etc. Among ecclesiastical buildings are Saint John's Church, an ancient structure in the pointed style, with a massive square tower, terminating in a spire, originally forming only one church, but now converted into three parish churches; Saint Paul's, also a parish church, of modern erection, with a lofty steeple; a handsome Episcopal cathedral and other churches.

Of industrial establishments the chief are large dye works, iron-founding and engineering industries, textile works, rope and twine (the great staple industry). There are also bleach-works. The shipping trade is small. There are extensive auction sales of cattle and other stock. The North and South Inches form beautiful public parks.

Perth was formerly known as Saint Johnstoun. It was created a royal burgh in 1210 by William the Lion, and the Scottish Parliament repeatedly assembled here. Among the most remarkable events connected with it are its capture and the carrying off of its records by Edward I of England in 1298; the bloody conflict on the North Inch between Clan Chattan and Clan Kay (1396); the murder of James I in 1437; the various events connected with the progress of the Reformation; the Gowrie conspiracy or Raid of Ruthven in 1600; the capture of the town by Montrose in 1644, after his victory of Tippermuir; its capitulation to Cromwell in 1651, and its occupation, first by Viscount Dundee in 1689 and afterward by the Highlanders in 1715 and 1745. Scone, the ancient place of coronation of the Scottish kings, is in the immediate neighborhood. Pop. 35,854.

PERTH, Western Australia, the capital of the state, on the Swan River, 12 miles above the port of Fremantle, which is situated at the mouth of the river. A macadamized road, constructed by convict labor, connects Perth with Fremantle, and there is also regular communication by water and rail. The city is built on a slope, washed at its base by a lake-like expanse known as Melville Water. The streets are regular and moderately wide. The principal public buildings are the city hall, the chambers of the legislative council of the state,

an assembly room and offices, two cathedrals, one Protestant and one Roman Catholic, a hospital, government offices, pensioners' barracks, a handsome mint, a fine new music hall, a mechanics' institute containing a museum, the Victoria public library, art gallery, government house, the high school, government and Roman Catholic schools and some handsome hotels and private residences. The waterworks are municipally owned and there is a good tramway system. A university was established in 1912. Pop. about 55,000.

PERTH, The Five Articles of, a measure, passed in a general assembly of the Church of Scotland, convened 25 Aug. 1618 at Perth by the order of James VI. The first required communicants to receive the elements kneeling; the second permitted the celebration of the Holy Communion privately in case of sickness; the third allowed private baptism on sufficient cause; the fourth required that children of eight years should be confirmed; and the fifth enjoined the religious observance of Christmas Day, Good Friday, Easter Day, Ascension and Whitsunday or Pentecost. These articles were accepted by the Estates in 1621, but were opposed by the Presbyterians of Scotland as an undue interference with the very constitution of the assembly. These articles became the source of much serious dissension between king and people, and in the general assembly held at Glasgow in 1638 the assembly of Perth was declared to be unlawful and null, and the Five Articles were formally condemned.

PERTH AMBOY, ăm-boi', N. J., city, port of entry, in Middlesex County; on Raritan Bay, at the mouth of the Raritan River, and on the Central Railroad of New Jersey, the Staten Island Rapid Transit, the Lehigh Valley, the New York and Long Branch and the Pennsylvania railroads, about 15 miles south of Newark and 21 miles in direct line south by west of Battery Park, New York City. It has extensive shipping interests on account of its good harbor. In the vicinity are valuable deposits of fire-clay. The first white settlement was made about 1683 at the site of an Indian village called "Amboy." The settlers were from Scotland and they named the place Perth, in honor of James, Earl of Perth. Soon after the Indian name "Amboy" was added. It was the capital of the province nearly all the time it was held as a colony of Great Britain. In 1776, William Franklin, the last British governor of the province, was captured here. It is a commercial and industrial centre of importance. The latest industrial census reported \$61,814,000 invested in industries; the cost of materials used was reported as \$135,745,000, and the value of products \$148,960,000. There were 128 industrial establishments employing 10,556 persons, of whom 9,202 were wage-earners, who received \$4,906,000 in wages, an average of \$533 per wage-earner per year. The sum of \$1,849,000 was paid in salaries to 1,252 salaried employees, a total of \$6,755,000 for all services, while \$13,215,000 was the amount added by manufacture to the raw materials. The war stimulated the city's industries very greatly, the above figures being dwarfed during the years 1917 and 1918. The chief manufacturing establishments are large lead and copper smelting and refining plants,

ship-building and repairing yards with dry docks, emery mills, brick, terra cotta, fire brick, white ware, drain pipes, handkerchiefs and underwear, corks, cables, iron and steel works, chemical works, cartridges and munitions factories, copper works, and railroad shops and yards. There are about 9,000 employees in the manufactories. The city has a high school, public and parish schools, a public library, one daily and three weekly newspapers. The three banks have a combined capital of \$500,000. The city owns and operates the waterworks and an electric-light and power plant. Pop. 41,707.

PERTHES, pĕr'tēs, **Friedrich Christoph**, German publisher and patriot: b. Rudolstadt, 21 April 1772; d. Gotha, 18 May 1843. After an apprenticeship of six years with a bookseller in Leipzig, he went to Hamburg in 1793, and in 1796 established himself there in the same business. In 1810 he initiated the patriotic publication known as *The National Museum*, to which men of eminent intellectuality were contributors, in an effort to arouse the patriotism of the People. On account of this ardent opposition to Napoleon's extension of power he was obliged to leave the city when it became a part of the French empire, and he remained in virtual exile until 1814. In 1821 he sold his interest in the business to his partner and moved to Gotha and founded there a prosperous publishing business, chiefly of historical and theological literature. In his extensive correspondence with men of note he accumulated a most valuable collection of autograph letters. An uncle of his, J. G. Justus Perthes, was the founder of the firm Justus Perthes of Gotha, celebrated later as the publishers of the famous geographical work 'Petermann's Mittheilungen,' and of the 'Almanach de Gotha.'

PERTINAX, pĕr'ti-nāks, **Publius Helvius**, Roman emperor: b. Alba Pompeia, in Liguria, 126 A.D.; d. Rome, Italy, 28 March 193 A.D. He was well educated, entered the army and distinguished himself in the service, attracted the attention of Marcus Aurelius who elevated him to the consulate in 179. He was in command of the legions which crushed the revolt in Syria, was governor in turn of Mæsia, Dacia and Syria, and under Emperor Commodus was placed in command in Britain. Later he became pro-consul of Africa and finally prefect of Rome. He was banished with others on suspicion of having been concerned in a conspiracy against Commodus; but on the death of the latter he was proclaimed emperor by his soldiers, 31 Dec. 192 and immediately set about forming a government which was to reform the abuses countenanced by his predecessor. He was well received by the senate and the people, but owing to the treachery of Lætus, prefect of the Prætorian Guard, who feared the loss of his own supremacy, Pertinax failed to retain the confidence of the Guard and was assassinated by that body three months after his accession.

PERTURBATIONS, in astronomy, deviations in motion of planets or comets from their fixed orbits or from the regular velocity in those orbits. They are regarded not as drawing the planets out of their orbits, but more in the light of change in elements of the orbits themselves.

PERU, Ill., city in LaSalle County; on the Illinois River and the Illinois and Michigan Canal, and on the Chicago, Rock Island and Pacific, the Chicago, Burlington and Quincy and the Chicago, Ottawa and Peoria interurban railroads, about 100 miles southwest of Chicago and 55 miles northeast of Peoria, five miles from Starved Rock and five miles from Deer Park, and at the head of navigation on the Illinois River. It was settled in 1827 and founded as a village in 1834. It was granted a city charter in 1852. In the vicinity are relics of the Mound Builders. Peru is in a locality favorable for manufacturing; large bituminous coal fields are near, and deposits of white-sand rock and cement rock. The chief manufacturing establishments are foundry and machine shops, planing mill, fertilizer works, grain elevators, clock factory, nickeloid works, zinc-rolling mills, scale works, plow and wheel works, furniture factory, shirt factories, acid factories, zinc smelters, nail and glazier paint factories, novelty works, weather-strip factories, implement factories, cigar and tobacco factories and furnaces. There are several wholesale houses. The city is the seat of Saint Bede College, opened in 1891 by the Benedictine Fathers, and it has public and parish schools and a free library, non-sectarian hospital and one of the very best hotels along the whole valley and large parks. The city owns and operates the electric-light plant and the waterworks. Pop. 8,869.

PERU, Ind., city, county-seat of Miami County; on the Wabash River, and on the Chesapeake and Ohio of Indiana, the Wabash, the Lake Erie and Western railroads, about 74 miles north of Indianapolis. Electric lines run to Warsaw, Indianapolis and elsewhere. It was settled in 1827; in 1834 was laid out as a town, and chartered as a city in 1852. There is a municipal park on the river and an amusement park nine miles away. It is in an agricultural section of the State, and is the commercial centre for a large extent of country. The chief manufacturing establishments are confectionery factories, glass works, steel works, wagon and carriage factories, woolen mills, carbon works, bagging and basket factories and railroad shops. It has a large trade in its own manufactures and in farm products. The city owns and operates the electric-light plant and the waterworks. Some petroleum is found near by. Pop. 12,561.

PERU, Balsam of. See **BALSAMS**.

PERU, pĕ-roo' (Sp. pā-roo'), Republic of, a country occupying a part of the western side of South America. Its boundaries touch on the north, Ecuador and Colombia; on the east, Brazil and Bolivia; on the south, Chile; on the southwest and west lies the Pacific Ocean, with a coast line of 1,350 miles. The location of these boundaries has been the source of many and serious disputes, which have in recent years been gradually settled through peaceful arbitration—with Colombia in 1909; with Brazil in 1910, and with Chile in 1912. The controversy with Ecuador, involving an area of about 100,000 square miles lying about the headwaters of the Amazon, was in a fair way of being settled when the European war broke out, but has been indefinitely postponed. No thoroughly reliable surveys of the

eastern district have ever been made. Estimates of the total area are, therefore, naturally far apart, but the total area claimed officially (1919) is 679,600 square miles.

Political Divisions.—In 1917 the country was divided into 19 departments and three provinces. The accompanying table shows their areas, and population figures as officially estimated in 1896; since which there has been no attempt at enumeration. The British foreign office in 1908 estimated the total population at 4,500,000, and this corresponds very closely with the figures in the table and bears out the opinion of travelers that the population of Peru is stationary. In the Peruvian census of 1876—the latest taken—the population was made up of 13 per cent white persons; 1.9 per cent negroes; 57.6 per cent Indians (South American); 24.8 per cent mestizos (Cholos and Zambos), and 1.9 per cent Chinese and other Asiatics. These figures are considered approximately correct at the present day. The 18 departments in turn are subdivided into 102 provinces.

and eastern ranges show through their whole extent peaks of great height (16,000 to 22,000 feet), the crowning summit, Coropuna, reaching 22,900 feet, and the twin-peaked Huascaran, 22,240 feet. The heart of the sierra, where Inca semi-civilization arose, is in a comparatively limited section, extending about 380 miles from south to north, between the great transverse ridge of Vilcañota and that of Cerro de Pasco. The main natural features of the Montaña are the rivers Marañon, Huallaga and Ucayali, each of these being navigable, and all uniting to form the stream which here is called the Solimões, but on its lower reaches, the Amazon. The sources of the first two are in the interior of the Sierra. On the other hand the southern portion of the Montaña forms its rivers on the eastern slope of the Andes, and sends them as affluents to the Madeira system. The most important of these are the Purus, Madre de Dios and Beni rivers. The absence of rain on a large part of the Pacific Coast is due to the fact, mentioned in the article SOUTH AMERICA (q.v.), that the

Topography and Hydrography.—The Maritime Cordillera, rising about 20 miles from the coast, and the great ranges of the Andes farther inland, divide Peru into three principal regions: (1) The central, called the tierra, including the parallel chains of mountains—the Maritime Cordillera, Central Cordillera and the Andes—together with transverse ridges, tablelands, deep gorges and intermediate valleys; (2) the Montaña, all that territory lying between the eastern Andean slope and the Brazilian and Bolivian frontiers; (3) the coast region, a practically arid belt about 30 miles in width along the Pacific, with oases along the 46-river courses crossing it. In the Sierra the mountains of the western section are volcanic, while those of the east have an entirely different geologic history. To the former are ascribed the violent earthquakes which have so often afflicted the country; the latter are famous for their past and present production of gold and silver. Both western

prevailing winds from the east lose all their moisture in passing over the Andes. Fogs and mists, however, are the source of very heavy dews, which are sufficient in many places to sustain a growth of grass. Forty-six rivers rising in the central or western Cordilleras, make their way to the ocean across this desert, their waters in some cases being utilized to irrigate the great sugar plantations in this coastal plain. The principal lakes are Titicaca, 12,545 feet above sea-level, now about 130 miles in length, but formerly much longer, and from 40 to 60 miles in breadth, its southern portion extending into Bolivian territory; Arapa; Umayo; Chinchaycocha, 36 miles long and 7 miles wide, and Parinacocha, 12 by 6 miles.

Climate.—The line of perpetual snow is usually about 16,400 feet, though in some situations only 15,400 feet, above sea-level. The elevated plains stretching between the mountain peaks are often exceedingly cold; the climate of the numerous deep valleys, however,

is tropical, and that of the intermediate slopes temperate. The rarefied atmosphere of the cooler uplands is healthful in certain respects only. Tropical conditions prevail on the lower altitudes of the Montaña and in the coast region, but with a marked difference: the former is exceedingly rainy, and the latter, from November to April, has no rainfall whatever, although the humidity is high—72° to 84°. By a law of 22 Dec. 1916 the government made provision for a vigorous campaign against malarial conditions throughout the country. The work involves the treatment of patients, the protection of people in regions where the disease is endemic, the destruction of insects transmitting germs and the drainage or special treatment of swampy lands. In connection with the campaign quinine is admitted free of all duties.

Flora and Fauna.—The coast region is treeless except for the mesquite and the Australian eucalyptus, which have been successfully introduced in some sections. The great forests which cover two-thirds of the entire area of Peru lie in the Montaña division. They contain an untold wealth of tropical timber trees of the most valuable woods: ebony, mahogany, cedar and other cabinet woods, besides dye-woods, innumerable rubber trees in several varieties and many wild olive trees. The cinchona tree, from which quinine is obtained; the sarsaparilla, vanilla and host of medicinal plants are characteristic of the Montaña. Fibrous plants abound and there is the greatest profusion of flowers, among them orchids, begonias and calceolarias, which are native here. In fact the Peruvian Montaña can show specimens of every tree and plant known to South American botany. The Sierra is said to be the original home of the potato, which is still found here in a wild state, but too bitter to be edible. The Sierra section is very rich in fodder grasses and has many of the familiar trees and plants of the temperate zones of other countries. The fauna of the Montaña includes the puma or cougar, the jaguar, the armadillo, the tapir, the peccary, the anteater and the manatee or sea-cow, and 30 species of monkeys, besides a great variety of small animals. Snakes, boas and vipers abound, and so do alligators and turtles. Parrots, flamingoes and a multitude of smaller tropical birds, butterflies, moths, beetles, flies and mosquitoes inhabit the forest. In the Sierra are found the characteristic group of wool-bearing animals: the llama, alpaca, guanaco and vicuña. The two former are domesticated; the other two roam wild, the guanaco in herds of 500 or more. The vicuña has been diminishing so rapidly that it is now protected by law. The fur-bearing chinchilla and several other rodents are denizens of the Sierra. The birds of this section are the familiar robins, flycatchers, finches and phoebes of the temperate zones, with partridges, ducks and geese, and the great condor of the Andes. In the coastal region there are lizards, scorpions and tarantulas. Seals visit the coast in large numbers and cod, haddock, mackerel, sole, plaice, flounder, smelt, lobsters and shrimp are plentiful in the coast waters. Among birds are the alcatras and gaviotas; and the gulls, terns and other marine species, in great numbers, frequent the small islands near the coast.

Agriculture.—Sugar is the most important crop grown and is cultivated mainly in the river valleys of the coastal section, chiefly in Lambayegue, Libertad and Lima. The largest sugar estates are in the Chicama and Cañete valleys. In 1916 the plantations covered 100,650 acres and gave employment to 23,456 persons, and the total production was 304,229 tons, of which 263,480 tons were exported. Cotton is cultivated on a large scale, the area in 1916 having been 139,087 acres. Several varieties are grown, but the main crop is of the Peruvian and the long staple Egyptian cotton. The former grows into a tree-like shrub, from 10 to 16 feet in height, begins to bear when eight months old and continues production for six years. The cotton area lies in Piura, Ica and Lima. Coffee is grown principally in central Peru, in the Chanchamayo and Perené districts of Junin and the Paucartambo district of Cuzco; the Huanaco district, and the Choguisongo and Carabay districts of Puno. Indian corn, which is indigenous to South America, thrives in all parts of Peru below the frigid table-lands. The district of Chancay alone produces annually 10,000 tons. Cacao grows wild in the Montaña and large plantations have been set out in Cuzco and Junin. The great native groves of rubber are on the eastern slopes of the Andes and in the region bordering the large rivers of the department of Loreto. The supply is so abundant that only one-hundredth part of the trees can be used. The rubber production amounts to more than 6,000,000 pounds annually. Coca is found wild in the forests, but there are also cultivated plantations, the largest in the Otuzco district. Cocaine is manufactured there and in Lima. Wheat, oats and barley are grown in perfection in the higher levels—between 5,000 and 11,500 feet elevation. Rice succeeds along the coast, principally in Lambay and the Pacasmayo valley in La Libertad. The annual production (1917) is over 46,000 tons. Grapes thrive in the coastal valleys, and there are several extensive vineyards where excellent wine is made. Olives also are of the finest quality and yield 30 per cent of oil, but are not largely grown. Other agricultural products are: Manioc, yams, tobacco, wax, honey, ramie, etc. Stock-raising, both of cattle and sheep, is carried on through the entire length of the country in the Sierra sections up to an elevation of 13,000 feet. Swine breeding is a considerable industry in the Chancay district. The wools of the alpaca, sheep and llama are grown for export as well as domestic use, the value of the exported wool reaching \$2,500,000 a year. Other products of the stock-raising industry which add to the exports of the country are hides, goat skins, horns, parchment, tallow, lard and horsehair.

Mineral Resources.—A late report of the Department of Fomento (Development) of the Peruvian government contains the following interesting statement: "The chronicles of the discovery and exploitation of Peru's chief mining zones during the colonial epoch make the most important chapters in the history of that period. The development of this industry was stopped, first, by the abolition of compulsory Indian labor, and, secondly, by the revolt of the Indians and the prolonged war for national independence. . . . Later, the easy and sure ex-

ploitation of the fabulously rich guano deposits rendered it unnecessary to risk capital and spend energies in the hazardous and difficult mining industry. When the guano deposits began to be exhausted, the men who had been engaged in that industry turned their eyes toward the rich mineral deposits of Peru and resolved to encourage their exploitation. The founding of the School of Mines in 1876 and the passage of the Mining Law of January 1877, which made the holding of mining property perpetual and irrevocable (contrary to the practice under the old Spanish codes), caused a renewal of this great national industry. Even with the meagre development of the present, the mineral resources of Peru have been shown to be of remarkable variety and prodigious extent. The minerals which have begun to figure substantially in the export trade of the country are few in number. In 1916 the list included the following: Copper, 96,968,000 pounds; value, \$24,000,000. Petroleum, 400,794 tons; value, \$7,500,000. Silver, 11,835,168 fine ounces; value, \$6,661,000. Vanadium ore, 3,801 tons; value, \$1,380,000. Gold, 67,264 fine ounces; value, \$1,239,000. Tungsten ore, 576 tons; value, \$1,089,000. Coal, 320,000 long tons; value, \$793,000. Lead, 2,246 tons; value, \$156,000. There were also reported small values in antimony, molybdenum, zinc, quicksilver, borax and salt. Other minerals known to exist in considerable quantities are nickel, bismuth, cobalt, iron manganese, magnesium, graphite and sulphur. Besides these there are large deposits of marble, porphyry, jasper, jade, alabaster, gypsum and kaolin. Copper is found chiefly in the region from Cajamarca to Cuzco. The predominant ores are grey copper and iron pyrites, carrying percentages of both gold and silver. The largest smelter in the country is at Cerro de Pasco. It has a capacity of 500 tons of ore per day. Petroleum is found in quantity over a large area along the coast, in the province of Tumbes, and the department of Piura and Lambayeque. The most prolific districts at present are those of Talara and Lobitos. Silver is extremely abundant on the eastern slopes of the Andes throughout the whole Peruvian section. The most famous silver district is that of Cerro de Pasco, in Junin, which has produced since 1630, when the Spaniards took possession, about 50,000 tons of silver. The principal ores are oxides, sulphides, and argentiferous galena. The largest lode known in the country is that of Carahuaca. Vanadium is found abundantly near Cerro de Pasco. Gold is found chiefly in veins of ferruginous quartz, accompanied by silver and copper. It is also found in the form of nuggets, and scattered through alluvial deposits, particularly in the provinces of Sandia and Carabaya in Puno, and Quispicanchi in Cuzco. The lode mines have been practically neglected. Coal exists in Peru in vast quantities in all sections, and in all forms—anthracite, bituminous, lignite and peat. The fields being worked are in Ancachs, Huaigavoc and Cajamarca, but the total output is relatively insignificant. Lead is found plentifully in all the silver-bearing sections. Nickel exists in San Miguel and La Mar; bismuth in Junin; molybdenum in Jauja; cinabar in Huancavelica; borax in Arequipa, Moquegua, Tacna and Puno; and sulphur both in the coast region and in the Sierra. The guano diggings have

diminished from the former prodigious output of 300,000 tons to about 60,000 tons per annum. The mining possibilities of the country are still practically undeveloped. While upwards of 10,000 mining claims are on record, only about 1,200 are being worked at all, and very few of these with any show of energy. The most serious obstacles to mining in Peru are the great altitudes at which the ores are found—8,000 to 12,000 feet—and their inaccessibility owing to lack of railroad facilities.

Commerce and Manufactures.—The value of exports from Peru, as shown in the report of the department of finance, has increased steadily with slight fluctuations since 1897. For the year 1916 the exports were valued at \$82,705,315 and the imports at \$43,415,750. Before the War Great Britain's trade with Peru was much greater than that of any other country and in some years even greater than that of the United States, Germany and France combined. But these conditions are changed, and in 1916 the United States bought more than 60 per cent of the total of Peru's exports; and supplied nearly 60 per cent of her imports—about four times as much in both cases as any other country. The imports from the United States for the year ending 30 June 1916, were valued at \$25,500,000; and exports to the United States at \$52,000,000. The chief imports and their values in 1916 were: textiles of wool and cotton, \$4,250,000; wheat, \$3,350,000; lumber, \$2,000,000; coal, \$1,850,000; industrial oils, \$1,500,000. The chief exports and their values were: copper, \$28,915,685 (more than double the value for 1915); sugar, \$19,362,725; cotton, \$8,320,605; alpaca wool, \$2,710,985; petroleum, \$1,773,115. The largest manufacturing industries in the country are those of sugar and cocaine. High speed mills of the most approved type are replacing the older machinery in the sugar mills, with the result that 90 per cent of the sucrose of the cane is secured as compared with the old record of 75 per cent. The 30 cocaine factories of Peru supply the whole world's demand for the drug. Textiles are woven in five cotton mills in Lima, and in several other cotton and woolen mills in other sections. The annual output of the wine presses amounts to 2,500,000 gallons; considerable beer is made; and there is a large quantity of alcohol distilled. There are 20 rice mills throughout the country, and 20 mills where cottonseed oil and oilcake are produced. The manufacture and sale of tobacco was made a government monopoly in 1909, and the industry is conducted for the government by an organization with headquarters in Lima. The production in 1915 was 359,300,000 cigarettes, and 152,900 cigars; in which was consumed 1,340,000 pounds of domestic grown tobacco, and 178,000 pounds imported from Ecuador and Colombia. Other industries are the making of flour, macaroni and vermicelli; chocolate; paper; leather; boots and shoes and saddlery; "Panama" hats; furniture and chemicals.

Navigation and Railways.—The chief port of Peru is Callao; Paita and Mollendo are also important as ports of foreign trade. There are a score of other Pacific towns which enjoy a coastwise steamship service. The Peruvian ports on the Marañon and Huallaga rivers in the east are connected by steamers with those of Brazil. In 1916 a total of 495 steamships

aggregating 1,037,404 tons entered the ports of Peru. Of these 135 were Chilean; 117 British; 78 Peruvian; and 47 of the United States. The railways in 1916 totaled 1,724 miles; of which 1,117 miles were under control of the Peruvian Corporation (see the section *Finance*). The table below shows the proposed railways, many of which are already completed or under construction:

Pascamayo to Eten.....	65.160
Chocope to San Pedro de Lloc.....	52.306
Trujillo to Rio Santo.....	113.360
Menocucho to Queruvilca.....	80.600
Lima to Huacho.....	253.391
Lima to Pisco.....	246.040
Oroya to Yucayali.....	528.
Yacucho to Cuzco.....	500.
Vitor to Sigauo & Camani.....	198.
Ilo to La Joya.....	158.365
Cuzco to Santa Ana.....	185.

Total (kilometers).....2,380.12

Post Office and Telegraph.—In 1916 there were 646 post offices in Peru, and in that year they handled a total of 26,688,754 letters and packets. There were 252 telegraph offices, with 7,849 miles of line, and handling 1,707,000 telegrams in the year. Wireless stations were established at Iquitos, Masisca and Puerto Bermudez in 1908; at Callao, Pisco, Chala, Ilo, and Lima in 1913; and at Leticia, El Encanto and Orellana in 1916. In 1917 a high-power station was erected at Cachendo, near Arequipa. There are 182,900 miles of telephone wire. Iquitos, department of Loreto, has the advantage of regular service by direct freight and passenger steamers from New York and Europe. Other river ports are Yurimaguas on the Huallaga, and Contamana on the Ucayali. The chief Pacific ports are visited by vessels of the Chilean and Pacific Steam Navigation companies. The railroads, 1,718 miles in extent (1,300 miles standard gauge, including 30 miles of interurban electric lines, and the rest narrow gauge) are in large part owned by the government, and 65 per cent (1,120 miles) are operated, under arrangements of long standing, by the Peruvian Corporation (Ltd.), which owns and operates a line of steamers on Lake Titicaca, the railroad connecting that lake with La Paz, etc. The Central Railway climbs from sea-level at Callao to the altitude 15,666 feet on its way to Oroya, over 140 miles of track, and on a short branch line attains 15,865 feet. Its Huancayo extension has 78 miles of track. From Oroya a railway extends to Cerro de Pasco (see section *Mineral Resources*). The Southern Railway climbs from Mollendo on the Pacific Coast to Arequipa (altitude about 7,600 feet) and thence up to 14,666 feet at Crucero Alto and so to Puno on Lake Titicaca and, by the Juliaca and Sicuani branch, to Cuzco. The Pan-American Union handbook *Chile* contains the statement that, beside the Central and Southern, the Peruvian Corporation also operates six other railroads in Peru, as follows: Paita to Piura Railway; the Trujillo Railway; the Pascamayo and Guadalupe Railway; the Chimbote, the Pisco to Ica, and the Ilo to Moquegua railways. These, and other short lines, serve portions of the littoral. In 1917 the government authorized the departmental board of Ancachs to construct an automobile road between the port of Casma and the city of Huaraz. The Department is authorized to contract a loan of 40,000 Peruvian pounds (pound = \$4.8665), with interest

and amortization not to exceed 10 per cent annually. The loan will be guaranteed by a small tax on freight transported over the road and by a yearly appropriation of \$2,000 in the departmental budget. The government has adopted recently a scheme of road building to apply to all parts of the republic. Roads are classified in four groups—national, departmental, provincial and district, according to the authority in charge of construction. For the national roads a staff of road engineers is organized and provided for in the annual budget. Roads from Andamayo to Ayo, San Miguel to Mount Pucamarca, and from La Mergerada to Luricocha are already under construction.

Weights and Measures.—The Peruvian *libra*=1,0143 pounds; *quintal*=101.44 pounds; *arroba*=6.7 gallons; *vara*=0.927 yard; the *square vara*=0.835 square yard. The metric system was formally adopted many years ago but was not put into operation until September 1916, and then only in Lima and Callao. It is official in all tariff applications. Congress passed a law 14 Dec. 1901, providing for the adoption of the gold standard on 1 March 1903. The Peruvian gold pound, or *libra* (equivalent to the British pound sterling), is the basis of the coinage. Silver is legal tender for all sums up to 100 soles (*sol*=\$0.487). The statement was officially made in August 1903 that "Ten silver soles are accepted and paid by the banks as the equivalent of the Peruvian or British pound sterling." The silver coins are the sol, half-sol, 1-5 sol, 1-10 sol and 1-20 sol. There are one-centavo and two-centavo bronze coins—100 centavos=one sol. Paper money is issued in one-sol, five-sol, one-libra, five-libra and 10-libra notes.

Government.—While in its main features the government resembles that of the United States, the differences are important. Thus, Congress consists of a Senate and House of Representatives, but Senators as well as deputies are chosen by direct popular vote, and the number of Senators representing each department in the national legislature is not invariably two, but from one to four, the larger number being conceded to departments which contain more than eight provinces. In 1918 the Senate had 52 members and the House 116 members. Every second year one-third of the members of each chamber are retired, the selection being made by drawing lots. The President is chosen by direct popular vote for four years, but he cannot serve for two successive terms; and, to provide for such contingencies as the death or disability of the chief executive, two vice-presidents are elected in the same manner. The executive appoints a cabinet of six ministers, removable at his pleasure. Official acts of the President require for their validity the signature of a member of his cabinet (compare PARAGUAY), the cabinet ministers being severally in charge of the departments of Foreign Affairs, War and Marine, Interior, Finance and Public Works, Justice and Worship and Instruction. The departments are divided into provinces (102 in all), each of which is administered by a prefect. The provinces are subdivided into districts (850 in all), each governed by a sub-prefect. The Supreme Court sits at Lima, and is composed of 11 judges. The country is divided into 10 judicial districts for which superior and minor courts are provided. The choice of Supreme

Court judges depends upon Congress and the executive; the latter selects judges of the lower courts from lists of candidates proposed by the higher tribunals.

Finance.—The improvement in the financial policy of the country during recent years has been marked. A syndicate for the collection of taxes began operation in April 1913, advancing as a loan the sum of \$6,225,000. The chief sources of revenue are customs, taxes, the salt and tobacco monopolies, posts and telegraphs, alcohol, opium, stamped paper, legacy and property transfers, etc. The expenditures are chiefly for the Bureau of War, Bureau of Finance, the Home Office, the Bureau of Justice and Instruction and the Bureau of Fomento. The revenues for the year ending 31 May 1916 were \$19,711,915, and the expenditures were \$15,968,045, showing a surplus of \$3,743,870. The estimated revenue for 1918 amounted to \$19,878,050. The foreign debt, consisting of loans contracted in England and large arrears of interest at the beginning of 1890 amounted to \$54,577,731. Railways, and certain rights over mines and lands, were ceded to the Peruvian Corporation, a foreign company representing the bondholders, for a period of 66 years, as the only feasible method of obtaining relief. As neither party to this contract fulfilled the obligations, the agreement was nullified, and in 1907 the Peruvian government began under a new contract to pay 80,000 libras per year for 30 years to the corporation. The latter completed certain railroad construction from which the government receives half the net receipts, and the lease of the corporation was extended 17 years—to 1921. Peru's total public debt in 1916 amounted to 6,983,010 libras (\$31,423,545).

Revenue and Banking System.—The delegation of Peru to the First Pan-American Financial Conference called attention to the increase in national revenue during the 17 years from 1896 (when the amount was \$5,643,570) to 1913 (when the amount was \$17,089,870); somewhat more, therefore, than 300 per cent. As chief sources of revenue we mention the Pacific Coast customhouses, tobacco monopoly, tax on spirits and salt monopoly. There was a marked falling off in the public revenues after the exporting and importing nations of Europe became involved in war; and this, in so far as it had not been met by a proportional reduction in the government's expenses, led directly to a situation fairly obliging the government to adopt plans for the protection of banks and private debtors (this includes the moratorium) and for a budget of reasonable proportions; it led also to that substitution of paper for metallic currency mentioned in the foregoing paragraph. The collection of taxes, with a single exception to be noted, is delegated to a joint-stock company called the National Tax Collecting Company (capital \$1,500,000) which charges 1 per cent on the revenue from general taxes, 6 per cent for collecting license fees in the capital and at Callao and 10 per cent for the administration of the piers at Tumbes, Supe and Chala. The exceptional collecting agency just referred to is the National Salt Company, another joint-stock and fiscal organization: to it the government delegates control of all the salt mines and deposits of salt in Peru. The distinguished authors of the memorandum we cite said that the national debt was \$28,932,286,

which shows, according to the accepted estimate of the number of inhabitants, a per capita debt of only \$6.42 or \$6.43. The banks mentioned were the Banco del Perú y Londres (paid-up capital \$2,500,000 and reserve fund \$1,500,000); Banco Internacional (authorized capital \$2,500,000, paid-up capital \$500,000, and reserve fund \$125,000); Banco Popular (authorized capital \$1,000,000, paid-up capital \$750,000, cash reserve fund \$310,000); Banco Italiano (paid-up capital \$1,000,000, reserve fund \$446,650, sinking fund \$75,000); Banco Alemán Transatlántico (a branch for transactions in Peru, \$1,000,000). The Commercial Code of Peru prescribes for foreign associations wishing to establish banks in this country (paragraph 11, article 21 and article 185) that they "shall produce and enter in the register a certificate issued by the Peruvian consul that they are constituted and authorized in accordance with the laws of the respective countries, in addition to their constitution and the documents required for Peruvian associations. . . . All banks must have in their vaults at least one-fourth in sterling of the amount of their indebtedness to the public." Banks must pay, "for inscription," or as initiation-fee, from one-fourth to one-half per thousand, calculated on the amount of the declared capital, and 5 per cent on the net earnings. The banking institutions of special and distinctive characteristics, to be added to the foregoing list, are the Peruvian clearing house (Banco de Depósitos y Consignaciones, capital \$500,000 subscribed by Peruvian banks), W. R. Grace and Company, and the Lima Savings Bank (Caja de Ahorros, capital \$100,000 and over \$1,000,000 in deposits).

Army and Navy.—Military service is universal and compulsory: three years in the active army, and 27 years in the three reserves. The peace army consists of 6,500 officers and men. There is also a semi-military state police; a body of 5,074 men, of whom 1,886 are mounted. The navy numbers seven vessels: an armored cruiser of 6,400 tons; two cruisers of 3,200 tons, and one of 1,700 tons; two submarines; and one torpedo-boat destroyer. There is also a fleet of seven small government boats on the Amazon.

Population.—Though the Quichua language is still spoken by a majority of the people of Peru (of whom 57.6 per cent are classed as Indians and 24.8 per cent mestizos), this linguistic unity by no means implies uniform characteristics; on the contrary, it is necessary to regard the present Indian population as descendants of many different native races of varying degrees of natural intelligence and physical vigor, the common tongue having been imposed by the conquering Inca tribe. Some of the Indians of to-day are found to be progressive—at least sufficiently so to encourage the hope that they may, little by little, become useful citizens in a civilized country; but other descendants of the aborigines seem utterly incapable and irresponsible. The negro and Asiatic elements are small; the white element 13 per cent.

Education and Religion.—The most ancient university in the New World, that of San Marcos at Lima, was founded in 1551; the university at Cuzco in 1598; the college at Arequipa in 1616. There are also a university at Trujillo, a school of mines and engineering at Lima, a school of arts and trades, a military

school, a naval school, and a school of agriculture. Like the neighboring republic of Ecuador (q.v.), Peru has been honored by the achievements of her historians and geographers, the Paz Soldans and others; writers on constitutional and legal subjects; poets and dramatists (comedies by Segura, etc.); and such naturalists as Rivero and Pinerola. Elementary education is compulsory for both sexes, but the law has never been enforced. Instruction is free in the public schools. In the government high schools, one of which is maintained at each of the capital cities of the departments, a small fee is required. The number of primary schools in 1916 was 2,296, with 3,304 teachers and 166,002 pupils. There were also 277 students in the normal schools; 5,202 in the high schools; and 1,791 at the universities. The Roman Catholic bishopric of Cuzco was founded in 1537, and the see of Lima in 1541. The provisions of the constitution and laws in regard to worship recognize only Roman Catholicism as the religion of the state, although other religions are tolerated as a social custom. All churches and convents belong to the state, and the government appropriates annually about \$80,000 for the maintenance of public worship.

History.—Before the coming of the Spaniards, the Sierra was held by Indians of the Inca tribe whose chief town was Cuzco. Chiefs of that tribe, "Incas" *par excellence*, had extended their conquests along the heights of the Andes, northward somewhat beyond Quito and southward into the Titicaca Basin. Unquestionably, also, they held in subjection tribes of the Pacific Littoral and Montaña regions; their commanding position, relatively efficient military organization, and use of the llama on long marches, enabling them to levy, even in remote communities, a tribute of "sun virgins" (female captives, who were assigned to the service of the national god), and of the precious metals, which were largely used, never as money, but for the interior decoration of temples and for domestic utensils. As for the social organization of the Incas, and the impressive accounts of the so-called dynasty which have been commonly accepted hitherto, it must be admitted that recent scientific researches conducted in the Sierra have put the whole subject in doubt. It is quite certain, for example, that the "empire" was ruled, not by a succession of enlightened administrators, but by war-chiefs, whose office was not hereditary; that extravagant notions have prevailed in regard to the defenses of the capital, the system of roads and the irrigation works; and that a reliable chronology begins with the Spanish conquest. On 14 Nov. 1524 Pizarro first sailed from Panamá. About three years later the Inca Huayna Coapac died, and a civil war broke out between north and south, Atahualpa commanding in the former section, Huascar in the latter. This disruption proved to be the Spaniards' opportunity. In January 1530 Pizarro again sailed from Panamá, and, after long delays, reached the Sierra. On 16 Nov. 1532 the Spanish force seized and imprisoned Atahualpa. Xeres, Pizarro's secretary, writes: "Atabaliba (Atahualpa) feared that the Spaniards would kill him, so he told the governor that he would give his captors a great quantity of gold and silver. The governor asked him: 'How much can you give, and in

what time?' Atabaliba said: 'I will give gold enough to fill a room 22 feet long and 17 wide, up to a white line which is half way up the wall.' The height would be that of a man's stature and a half. He said that, up to that mark, he would fill the room with different kinds of golden vessels, such as jars, pots, vases, besides lumps and other pieces. As for silver, he said he would fill the whole chamber with it twice over. He undertook to do this in two months." February 1533 Almagro arrived; 3 May 1533 the gold and silver were melted; 29 Aug. 1533 Atahualpa was garroted. On 6 Jan. 1535 the site of Lima was chosen; the city founded 12 days later. On 8 April 1537 Almagro seized Cuzco; 8 July 1538 he was condemned to death. Two years afterward, Gonzalo Pizarro started to explore the Montaña; Sunday, 26 June 1541, Francisco Pizarro was assassinated. June 1542 Gonzalo Pizarro returned to Quito. From 28 Oct. 1745 to February 1746, earthquakes occurred destroying Callao; 1780 to July 1783, Tupac Amaru, descendant of the Incas, rebelled; 3 Aug. 1814 the cry of independence was raised at Cuzco; September 1820, the Argentine general, San Martín, landed on the coast of Peru, Lord Cochrane and English officers accompanying him from Chile (q.v.); 28 July 1821, independence was proclaimed at Lima, after San Martín's entrance; 20 Sept. 1822, San Martín resigned protectorate; 1 Sept. 1823, Bolívar arrived at Lima; 6 Aug. and 9 Dec. 1824 the Spanish forces were defeated at battles of Junín and Ayacucho; 24 Aug. 1827, General Lamar elected to the presidency; 16 Oct. 1856 the existing constitution was framed, and 25 Nov. 1860 revised; 2 May 1866 a Spanish fleet, sent to enforce alleged claims, was repulsed at Callao; 13 Aug. 1868 and 9 May 1877 destructive earthquakes occurred; 5 April 1879 Chile declared war against Peru; 8 Oct. 1879 the Huascar was captured by Chilean iron-clads; 17 Nov. 1879 battle of Tarapacá, the Peruvian province of that name falling into the hands of the Chileans; 26 May 1880, battle of Tacna; 7 June 1880, Chileans captured the port of Arica; the Peruvian army was nearly annihilated; Chilean ships desolated the whole coast; 13 and 15 Jan. 1881, Chilean invading force defeated Peruvians at Chorrillos and Miraflores; 17 Jan. 1881, Chileans entered Lima; 20 Oct. 1883, a treaty was signed, ceding Tarapacá to Chile, and providing for the occupation of Tacna and Arica by the Chileans for 10 years, at the end of which period the inhabitants should determine by vote whether they would belong to Chile or Peru. But it was also provided that the nation preferred by the voters should pay \$10,000,000 to the other nation; and when the time arrived for holding the plebiscite, Peru was unable to give attention to the matter and unprepared to pay the stipulated sum, in the event of a favorable decision. On 25 Nov. 1901 an agreement was made with Bolivia for the settlement of the boundary disputes by arbitration. In September 1903 Manuel Cándamo was inaugurated President but he died in May 1904 and was succeeded temporarily by Señor Calderón, the Second Vice-President, as the First Vice-President had also died. Elections were immediately held and José Pardo was chosen President and installed in September 1904. On 24 Sept. 1908 Augusto B. Leguía was

inaugurated President. On 29 May 1909 President Leguía and several members of the Cabinet were captured by a band of desperate men in an attempt to overthrow the government. After being paraded through the streets of Lima and threatened with death if he did not resign, Leguía was rescued by the loyal troops and the conspirators captured or put to flight.

In 1912 the Chilean occupation or tenancy of Tacna and Arica was confirmed, in perpetuity, by agreement between the two countries. On 6 Dec. 1914 a severe earthquake in the department of Ayacucho killed a number of people and destroyed many buildings. In 1915 important archaeological studies were made by an expedition under the auspices of Yale University and the National Geographic Society (of Washington); the excavation of the large ruins of Patallacta at Qquente was carried on with care, although seriously hampered by unfriendly action on the part of the Historical Institute of Cuzco; and, before the reconnaissance work was stopped by the government, addition was made to the new learning in regard to the region of the Machu Picchu ruins. In February 1914 Colonel Benavides led a military uprising against President Billinghurst who was accused of autocratic methods of government. The movement resulted in the exile of Billinghurst and a provisional government was set up with Benavides at the head. During that year Provisional President Benavides, "as a reply to the charges that he desired to establish a dictatorship," issued a call for an election; his candidate was defeated; Dr. José Pardo, coalition candidate, was elected; and Benavides was accused, in charges presented to Congress, "of abuse of power, the assassination of General Varela, treason, rebellion against the government of Billinghurst, securing loans without previous consent of Congress and amassing wealth while in office." Congress ordered an investigation. The same body approved, in October, a constitutional amendment guaranteeing religious liberty; but President Pardo refused to sanction or to veto that progressive measure (see *Education and Religion*), and upon its promulgation by Congress a demonstration of hostility was made in the streets of the capital.

MARRION WILCOX.

PERUGIA, pā-roo'ja, Italy, (1) a city, capital of the province of the same name, on the side and summit of a lofty eminence washed by the Tiber, 84 miles north of Rome. It is surrounded by lofty walls, and defended by a citadel; has irregular but spacious streets, and many remarkably handsome buildings. Among its edifices are the unfinished cathedral, a bold Gothic edifice of the 15th century, possessed of a valuable library rich in works and manuscripts connected with biblical literature; the church of Saint Agnese, adorned with frescoes by Perugino and his pupils; the oratory of San Bernardino, with a magnificent façade in which colored marble and terra-cotta are employed; the convent of San Severo, now a college, containing the first fresco painted by Raphael; the church of San Pietro de Cassinensi, dating from the 10th century, with a roof supported by marble and granite pillars taken from a heathen temple, and so rich in pictures as almost of itself to form a gallery; the 13th century church of San Domenico, with some fine monuments; the Palazza Pubblico or town-hall, a majestic edifice of the 13th century, containing the valuable Vannucci picture-gallery and a library of 77,000 volumes; the Collegio del Cambio or Exchange, no longer required for that purpose but interesting from the number of fine frescoes with which Perugino has covered its walls; the prefecture, a handsome modern building; a fine public fountain; the arch of Augustus, a fine ancient gate, built of massive blocks of travertine without cement. Perugia possesses a free university, founded in 1320, with about 270 students, a library of some 54,000 volumes, a museum of antiquities, a botanical garden, etc. The manufactures, comparatively unimportant, consist of velvet, silk stuffs, brandy, etc. The trade is in grain, oil, wool, spun silk and cattle. Perugia (then known as Perusia) under the Romans and in pre-Roman times was one of the 12 principal cities of Etruria, and remains of the ancient necropolis with the tomb of the Volumnii, dis-

covered in 1480, are to be seen three miles southeast of the city. Having taken the part of Mark Anthony in the war between him and Augustus, Perugia was sacked. In the 6th century, Totilla, one of the northern barbarians, took it after a siege of seven years, and put many of its inhabitants to the sword. Pepin le Bref, king of France, took Perugia in the 8th century, and made a present of it to the Pope. It suffered much during the contests between the Guelphs and Ghibellines, and both in the 14th and 15th centuries was fearfully ravaged by the plague. It was joined to the papal states in the middle of the 16th century. The Sardinians annexed it to what is now the kingdom of Italy in 1860. The celebrated painter, Pietro Vannucci or Perugino (q.v.), though born in Citta della Pieve, long made Perugia his adopted home, and died in it a victim of the plague in 1524. Pop. about 66,000. (2) The province of Perugia or Umbria has an area of 3,748 square miles. It is traversed in all directions by offsets of the Apennines. The principal stream is the Tiber. The soil is fertile, producing in abundance corn, wine, fruits, oil and silk. Pop. about 686,000. (See UMBRIA). (3) The Lago di Perugia, is about 10 miles long, by eight in breadth, and surrounded with olive plantations. It contains three islands—Isola Maggiore, Isola Minore and Isola Polvese; and abounds in fish. It appears to have no natural outlet, and its shores used to be often overflowed, but this was remedied by an artificial outlet opened in 1896. Hannibal gained a signal victory over the Romans near this lake in 217 B.C., as related by Livy (XXII, 3-6). (See HANNIBAL). Consult Cruikshank, 'The Umbrian Towns' (1901); Heywood, W., 'History of Perugia' (New York 1910); Symonds and Duff-Gordon, 'The Story of Perugia' (London 1900).

PERUGINO, pā-roo-jē-nō, easel name of PIETRO CRISTOFORO VANNUCCI, Italian painter: b. Citta della Pieve, near Perugia, 1446; d. Castello di Fontignano, near Perugia, 1524. It is quite probable from indications in his early painting that Fiorenzo di Lorenzo was his teacher, while according to Vasari he completed his studies under Verrocchio at Florence, was a fellow-pupil of Leonardo da Vinci (1475) and gained much skill in tempera painting, though he was subsequently among the first Italians to use oil as a vehicle. In 1475 he painted frescoes in the town-hall of Perugia. He worked for Sixtus IV in the decoration of the Sistine Chapel, where his 'Christ Delivering the Keys to Peter' and 'Baptism of Christ' are still admired (1483-86). At Perugia to which city he finally returned and where he took up his residence, Raphael, then a boy of 12, became his pupil. His first easel pictures, two Madonnas, are now one in the Louvre, the other in the English National Gallery, and exhibit that tenderness and grace, yet strength of expression, which belong to all his works. While his earlier pictures belong to the Quattro-cento style his latter productions show the influence of Michelangelo and Leonardo, exponents of the Cinque-cento style. Among his best pictures, which he executed in the latter manner (1490-1505), is 'The Marriage of the Virgin,' now in the museum at Caen, and widely known through the Arundel print reproduction. This

work, however, has recently been attributed to Lo Spagna. To the same period belong 'The Ascension of Christ' in the museum at Lyons, which is one of his masterpieces, combining strength of composition with intense religious feeling; and 'The Assumption of Saint Mary the Virgin' for the Church of Santa Maria Maddalena de Pazzi at Florence. Among his last works were the 'Martyrdom of Saint Sebastian'; 'The Baptism of Christ'; 'The Transfiguration'; and 'The Birth of Christ' in the church at Fontignano. It was after completing this picture that he was struck with the plague from which he never recovered. He was a prolific and industrious artist, and even during his lifetime foreign merchants carried his pictures into every country of Europe, where they are to be found in all the great public and many private collections. He made a really original departure in Italian art, and molded the style of Raphael in its early stages, though the latter quickly developed a manner and spirit pre-eminently his own.

PERUVIAN ANTIQUITIES. See PERUVIAN ARCHÆOLOGY.

PERUVIAN ARCHÆOLOGY. During the pre-Incaic and Incaic periods ancestor-worship, hero-worship and sun-worship all exerted a remarkable degree of influence in the Andean highlands. We may appreciate the effect of ancestor-worship in the remote past if we give attention to the fact that even to-day the most important article of the simple faith of one of the native races is that human beings are transformed into Achachilas after death. Now, these Achachilas are, according to the belief of the natives, powerful spirits or demons living in every mountain, every lake, meadow and stream, and exerting most active influence in control of the lives and fortunes of men—to such an extent, indeed, that no important undertaking is begun until the Achachilas of the neighborhood have been propitiated by symbolic offerings. With similar motives, so far as we may judge, in prehistoric times every effort was made to express by means of burial customs the belief in what may be roughly described as immortality on earth. Thus, for example, offerings of the products of industry and of art were placed near the mummified body in its burial cave to express firm assurance that the ancestor still continued his conscious participation in the activities of his descendants; and it is obvious that such objects as these supply the archaeologist with trustworthy data.

Again, we may at least begin to appreciate the driving force of hero-worship and sun-worship if we give attention for a moment to a tradition that deals not only with one of the most heroic of Inca rulers but also with the extremely interesting Temple of the Sun at Cuzco, that famous mountain-built city which was the capital of the Inca tribe and nation before the Spanish conquest of Peru.

The descriptions one may still hear if one talks with educated Cuzqueños about the egregious symbolism of the interior decoration of the principal temple are certainly fancy-stirring. In pre-Columbian times the high altar, which faced the east, held the "effigy" of the sun,

which was made of gold encrusted with precious stones.* The walls also were covered with gold wrought in various shapes. Seated in a semi-circle on their thrones, right and left from the image of the god, were the mummies of the "children of the sun," the Inca chiefs, ranged in the order of their succession, from Manco Ccápac to Huayna Ccápac. Light was admitted through a single aperture, in the eastern wall, so situated that when the sun rose to a certain height its rays pierced the obscurity and fell upon its own image, which then suddenly, with glow of gold and gleam of emeralds, illuminated this chamber "long to quiet vow'd." It is said that the face of every other enthroned Inca was averted reverently from the god, but the corpse of Huayna Ccápac had been placed in the attitude of fearless scrutiny; and this for the reason that in his lifetime he claimed that his own power was absolute, while even the freedom of action of the god was limited. One day (so the story goes) when a religious ceremony was being performed in the great square of Cuzco, Huayna Ccápac looked up at the sun in the zenith, staring at it so fixedly that the high priest remonstrated: "Do you forget, son of the sun though you are, that the law of our religion forbids even you to gaze on him impiously?" "You are right about the law," replied the chief, "but consider the facts. Do you believe anyone could oblige me to do a thing contrary to my free choice?" "Impossible!" the high priest exclaimed. "Now listen," continued the Inca. "This sun does the same thing day after day, always rising in one quarter, always going down in another, and holding one course unalterably. Why? Because he is not his own master. He is commanded to do it. Therefore he is not and cannot be god." It seems probable that the superstitious and patient native laborers of an earlier day accomplished the most difficult tasks (the ancient faith being then unshaken) under twofold inspiration; that when they built a great stone fortress, palace or temple they did the work as servants of the life-giving god of all the people and as subjects of some scarcely less revered ruling family, conspicuous members of which were regarded as intermediate in nature between gods and men. This seems to be true especially when we study architectural remains of the pre-Incaic or megalithic period.

These megalithic, pre-Incaic monuments are found in many parts of the Peruvian and adjacent Bolivian highlands, and are generally regarded as works of a superior native race which, after being from earliest times the dominant factor in the population of the best portions of that whole region, had the misfortune to be overcome, and ultimately to a large extent exterminated, by savage invaders about the time of Christ. Professor Bingham (see *Bibliography*) writes in *Harper's Magazine*: "Sir Clements Markham in his book on the Incas of Peru devotes a chapter to a myth which was told to all the Spanish chroniclers by their native informants, which he believes is the fabulous version of a distant historical event." The gist of the native informants' accounts was that people of the early megalithic period were conquered by a great incursion

from the south. The whole country broke up into anarchy, and savagery returned, ushering in a period of mediæval barbarism. Remnants of the megalithic folk took refuge in a district called Tamputocco (or Tampu Tocco) where they were protected from the invaders by the inaccessible character of the country. Here the fugitives multiplied. Their descendants, more progressive and powerful than their neighbors, "in time became crowded, and started out to acquire a better and more extensive territory. The legend relates that out of a hill with three openings or windows there came three tribes. These tribes eventually settled at Cuzco and founded the Inca empire."

At Tiahuanaco the groups of megalithic ruins are called by local scholars simply the "monumentos prehistóricos" and the city which occupied this site is commonly assigned to a remote period antedating changes traditionally reported (compare second part of Cieza de León's *Crónica del Perú*) to have occurred in the topography and climate of the high plain of Peru and Bolivia at this point. Thus, a South American author says that the construction of an edifice which he calls the "palace" shows clearly that the climate at the time when this building was erected must have been positively warm; that it was "benignant" then because this Andean plain had not attained its present altitude, and the inhabitants were able to devote themselves to such gigantic works as these which excite our wonder at Tiahuanaco because climatological conditions in those days favored the development of a large agricultural and industrial community; that Lake Titicaca occupied a larger part of the high plain, and Tiahuanaco was an island. The view he has expressed, to the effect that the region in question was much lower and less bleak when Tiahuanaco was built, is one that is commonly shared by travelers who study the ruined city at all carefully. Sir Clements Markham, in an address published in the *Geographical Journal*, says: "Some miles from the southern shores of Lake Titicaca, once actually on the shore, there are the ruins of a great city, now called Tiahuanacu. (There is good authority for spelling the name either Tiahuanaco or Tiahuanacu). In the time of the Incas it was the same ruin as it is now, its origin and history absolutely unknown, and myths were invented to account for the numerous stone statues. The ruins show very advanced proficiency in the masonic art, and there are monoliths which have been conveyed from great distances. The size of these cut and carved stones is unequalled in any other part of the world except Egypt. There must necessarily have been a very large population and an immense food supply. But at the present time we observe that corn will not ripen in this neighborhood, because the climate is too rigorous. The question how a region where corn will not ripen can have been selected as a site for a great city is a problem which seems well worthy of study." A discussion which arose after the reading of that address related chiefly to the rather startling suggestion that the Andes have risen 1,000 feet in height since certain stone remains were deposited at Tiahuanaco by man, as the president of the Royal Geographical Society, Maj. Leonard Darwin, expressed it. Continuing, the

*According to early Spanish accounts, a conventionalized discoidal representation.

president said: "In considering this question, what we should like to know in the first place is, what is the age of these ancient ruins? . . . Judging by the age now generally assigned to the pyramids of Egypt, it would not be an outrageous supposition to suggest that these megalithic remains may be 4,000 years old." Sir Martin Conway said that observations he himself had made in the same upper region led him to conclusions not at variance with those expressed by the other members.

One consideration which was not mentioned during that discussion at the Royal Geographical Society has, we think, direct bearing upon the problem. When the writer walked over the fields near the famous "artificial hill," noticing how great the distances are between vestiges of old Tiahuanaco on the north and south sides of the valley, and paying attention to the evidences of vast and exceedingly laborious undertakings, it seemed obvious that we must take into account the rarefaction of the air which, at an altitude of 12,500–12,600 feet occasions a more or less clearly marked aversion to long-sustained physical effort. If we forget all we have ever read about the place, and simply let the monuments tell their own story, we are quite certain to receive an impression predisposing us to favor the view that blocks of stone of such enormous size (and one brown-red slab that we measured in the Puma-Puncu district of Tiahuanaco was more than 27 feet long, 18 feet wide and from three to six feet thick) were quarried at Andamarca de Quimzachata or still more remote places and brought to this point before the plain had been uplifted above the present level of Cuzco.

Recent discoveries made by the Yale Peruvian expedition supply a connecting link between the builders of Tiahuanaco and the Incas. The leader of that expedition believes the place now called Machu Picchu "to have been the original Tampu Tocco, from which the Incas came when they started on that migration which led them to conquer Cuzco and to establish the Inca empire"; and it seems almost certain that the investigations carried on at Machu Picchu since 1911 shed light on the pre-Incaic as well as the Incaic periods. Professor Bingham claims for Machu Picchu a superiority in extent and interest over previously discovered Incaic ruins, saying that those in the city of Cuzco and on the islands of Lake Titicaca, the town and fortress of Ollantaytambo, Pisac, Ancón (near Callao), Pachacamac, Nazca, Trujillo, Vitcos and the country of the grand Chimú, "where the chief interest lies in the extensive findings of mummies, pottery, textiles and metal ornaments, including gold, silver, bronze, etc.," were known to the Spanish conquerors and have been despoiled by treasure-hunters. On the other hand, Machu Picchu, which is larger and contains more edifices than any other ruin discovered in Peru (except Cuzco), was not known to the early Spaniards, was not occupied by their descendants, and, not having been the treasure-hunter's prey, survives to-day in a remarkably good state of preservation. It is found that the ancient inhabitants of Machu Picchu were, like the citizens of Tiahuanaco, masters of the art of cutting and handling great blocks of stone. Thus, a single piece of granite in the east wall of the chief

temple on the sacred plaza at Machu Picchu measures 13½ feet in length and nearly eight feet in height. The builders of Machu Picchu knew how to make bronze; their pottery is varied in form; they understood how to plan and accomplish great architectural and engineering works; they utilized for intensive agriculture (on the patiently constructed *andenes*, or terraces) every square yard of available land within a radius of several miles; ignorant of writing, they employed small stone discs which "seem to be pre-Inca and may have been used to keep the records of Tampu Tocco before the discovery of the *quipu*, or knotted string"; and they divided their city into wards or clan groups, each ward having but one entrance, a gateway that could be securely closed. Dr. Eaton, the osteologist of the Peruvian expedition of 1912 under the auspices of Yale University and the National Geographic Society, writes in regard to Machu Picchu burial customs: "In only a few instances were the remains actually *inhumed*, that is, entirely covered with earth. The large majority of burials were made in caves, where the remains would be well protected from moisture and sunlight. When skeletal material was obtained from such sheltered places there were usually indications that the greater part of each mummy or body had been originally left above ground. I think that whenever there was sufficient head-room, the mummies were placed sitting in the contracted position." See also the article INCA SEMI-CIVILIZATION.

MARRION WILCOX.

PERUVIAN BARK. See BARK, PERUVIAN; CINCHONA.

PERUZZI, pā-root'sē, Baldassare, Italian painter and architect: b. Accajano, near Siena, 1481; d. Rome, 6 Jan. 1536. He settled in 1503 in Rome, where he began a study of the antique. He painted in the church of Santa Croce in Gerusalemme and designed the Villa Farnesina (1509–16). In 1520 he succeeded Raphael in the construction of Saint Peter's, changing Bramante's plan from a Latin into a Greek cross. This design, however, was not carried out. From 1527, when he was made architect to the city of Siena, he built many palaces there. He was again busy with Saint Peter's and Roman palaces from 1530. Of his

paintings special mention should be given to his fresco of the 'Sibyl Proclaiming to the Emperor Augustus the Coming of Christ,' in the Fontegiusta Church of Siena. Consult the study by Redtenbacher (1877).

PERVIGILIUM VENERIS, the Vigil of Venus, a short Latin poem of 93 lines, of which the author, date and place of composition are unknown. It is, however, of the 2d or 3d century A.D.; was written professedly in spring on the eve of a festival in honor of Venus. It is the "spring poem" par excellence. The refrain is "Cras amet qui nunquam amavit; quique amavit cras amet" which may be freely translated:

"Who hath never loved,
Shall he love to-morrow?
From to-morrow who hath loved
Shall he again love borrow?"

In the *Classical Review* (May 1905) an article assigned the poem to Sidonius Apollinaris.

PESADO, José Joaquín de, hō'sā hō-ā-kēn' dā pā-sā'dō, Mexican poet: b. San Agustín del Palmar, Mexico, 9 Feb. 1801; d. City of Mexico, 3 March 1861. He was self-educated, acquired an extensive knowledge of languages, science and history and in 1833 entered public life as a member of the legislature of Vera Cruz. In 1834 he was elected governor of that state and in that year founded and conducted *La Oposición*, also writing a short novel. He was appointed Minister of the Interior in 1838, Minister of Foreign Affairs in 1846, resigning in 1854 to accept the chair of *belles-lettres* at the University of Mexico. His poetry was of the neo-Catholic school established in France by Lamartine, but though excelling in biblical subjects his descriptions of nature are quite as deserving of attention. He published 'Poesías originales y traducidas' (1839); 'La Revelación' (1856); 'Gerusalemme Liberata,' a partial translation of Tasso (1860). Consult Bárcena, José M. Roa, 'Biografía' (Madrid 1878).

PESARO, pā-sā'rō, Italy, capital and port of the province of Pesaro e Urbino, situated at the mouth of the Foglia (which, like the town, was known in ancient times as Pisaurum) in a fertile plain backed by the Ardizi Hills, on the railroad between Bologna and Ancona. The castle and part of the mediæval walls are still standing; a bridge dating from Roman times crosses the Foglia; and the most important buildings are the ducal palace, built by the Sforza in 1455; the Palazzo Almerici, connected with which is the Ateneo Pesarese, containing a remarkable collection of majolica ware, a gallery of paintings and the rich Olivieri Library with 40,000 volumes and 3,000 manuscripts, including some of Tasso and Poliziano; the cathedral of S. Francesco, with a Gothic portal and a 'Madonna' by Bellini; and excellent schools, a theatre and an insane asylum, as well as a musical lyceum founded by Rossini, a native of the town. The grave of the Roman tragedian Accius (b. here 170 B.C.) is reputed to be about two miles from the city on Monte Santo Bartolo. Terra-cotta wares, silk, hemp and woolen textiles, sealing-wax, cream of tartar, ships, machinery, etc., are among the city's manufactures. It exports the product of the surrounding country, its figs, olives and truffles being particularly prized.

Settled by the Sicilians in early times, and then held by the Umbrians, Etruscans and Senonian Gauls, successively, in 184 B.C. it became the Roman colony of Pisaurum; was destroyed by Totila, the Ostrogoth; was given by Pepin to the Pope; and in 1631 again became a papal state, after being a possession of the Malatesta (1285) the Sforza (1445) and the Rovere (1512). Under the latter the city became a centre of art and literature through the patronage of Lucrezia d'Este; Bernardo Tasso wrote 'Amadis' here and the city was also the home of his son Torquato Tasso.

PESCADORES, pēs-kā-dō'rēs, **PENG-HU**, or **HOKO-TO**, a group of 48 small islands in the Fu-kien Strait between China and Formosa, forming an administrative dependency of the latter. Area, 85½ square miles. With Formosa they were ceded by China to Japan in April 1895 after the Chino-Japanese War. They are dangerous to ships passing through the strait, and are subject to stormy weather, on an average during 230 days of the year. Fishing is practically the only industry. Safe anchorage is obtainable at Makung on Hoko-to, the principal island. Pop. about 60,000, mostly Chinese.

PESETA, pē-sā'ta, the chief Spanish monetary unit, equal to about 20 cents.

PESHAWAR, pē-show'ūr, or **PESHAWUR**, India, (1) a city, capital of the Northwest Frontier Province, and of the division and district of Peshawar, in a small plain near the Kabul River, about 12 miles east of the eastern extremity of the Khyber Pass (q.v.). It is surrounded by a mud wall and entered by 16 gates. The Kabul gate has been rebuilt as a memorial to Sir Herbert Edwardes. Just outside the wall on the northwest is the Bala Hissar, a fort built of sun-dried bricks surmounting a small eminence, and completely commanding the town. The houses generally are built of brick and mud with wooden frameworks. The chief buildings and institutions comprise some handsome mosques, a clock-tower, English church mission, collegiate school, the Egerton Hospital, Martin lecture hall and institute, etc. The town is well drained and has an ample supply of well and canal water. Outside the wall are gardens and pleasure-grounds, and two miles to the west are the extensive military cantonments, where most of the civil offices are situated. Peshawar is traversed by the great route from Khurasan and Kabul to India through the Khyber Pass; and has a good trade. It has direct railway communication with Lahore through Attock and Rawal Pindi. Pop. about 100,000, including about 20,000 in the cantonments. (2) The district is the central one of the division. Area, 2,611 square miles; pop. about 800,000.

PESHITTO, pē-shē'tō, the standard Syriac version of the Holy Scriptures. See BIBLE, VERSIONS OF.

PESHWAS, the Brahman ministers of the great Mahratta dynasty in India, who in 1718 rose to such power that they ruled the Mogul Empire for a century. See INDIA, History.

PESO, pā'sō, a Spanish coin; a unit in many South and Central American countries, varying in value from \$1.03 in Uruguay to 36½ cents in Chile.

PESSIMISM, an attitude towards the world, or a theory expressive of an attitude, which finds evil in general preponderant over good, unlike optimism (q.v.), which finds good dominant. Pessimism need not be articulate, and even if articulate, need not be reasoned. The book of Ecclesiastes is an example of pessimism of this naïve type. Theories may be designated pessimistic either from an internal or an external standpoint, according as the moral value they assign the universe as a whole fails to fulfil the norms of the proponents of the theory or of external critics, respectively. As European ethics in the past has been predominantly Christian, setting a high worth on a personal God, on personal immortality and on order it has treated pantheistic, atheistic, agnostic or materialistic theories as pessimisms, and has likewise given a pessimistic interpretation to Oriental speculations which find the goal of all conduct in the abolition of the individual and his identification with the universe. These theories may be optimisms from the standpoint of their advocates, and as a matter of fact many of them are thus regarded. True philosophical pessimism, recognizing itself as such, is much less prevalent, though views which regard the world of appearances as essentially evil, and the sphere of the good as that of reason or worship or of some other higher activity, have been common ever since Parmenides. The first noteworthy example of true pessimism is to be found among the Epicureans, who considered pleasure as the mere absence of pain, yet regarded it as the greatest good. Scepticism led to a similar conclusion. In modern times, the chief exponent of pessimism is Schopenhauer (q.v.), who finds the true nature of the world in blind, purposeless, unhappy Will, which is "the living principle of reason" itself. Like the Buddhist, he finds the highest good in the annihilation of consciousness by suffering and sacrifice and artistic contemplation; but unlike the Buddhist he tends to regard this, not as a positive good, but rather as a mere respite from evil. Schopenhauer's pessimism is the result of the compounding of an Oriental natural history of values with Occidental norms. A similar view was held by von Hartmann, who attempted to mediate between Will and Reason by the essentially voluntaristic Unconscious. The philosophy of Nietzsche, notwithstanding the belief in the ultimate appearance of the Superman, contains a strong pessimistic trend in its condemnation of morality as it now exists.

Pessimism and optimism are not necessary alternatives, for they consist in an evaluation of the world as a whole, and the world, as a completed, conceivable whole may not exist, or if it exists, may not be subject to an evaluation. For example, it is quite possible that good and bad are terms which have no intrinsic meanings, but merely signify "better than some given standard" or "worse than that standard." In such a case, it is quite reasonable to suppose that the world as a whole or human life as a whole furnishes the norm by which good and bad are judged, and the problem whether the world is good or bad loses all significance. The question might still remain open as to whether the general tendency of the world is to improve morally or to deteriorate.

The theory that there is a general trend toward better things is called *meliorism*; the theory which finds the opposite tendency has no generally accepted name, but has been called *pejorism* by Max Müller. Pejorism is much rarer than pessimism; meliorism is the prevalent ethical opinion of the present time and has probably always occupied that position. That the world has any definite moral trend, however, whether for better or for worse, is not evident a priori. See **OPTIMISM**; **PROGRESS**; **SCHOPENHAUER**.

NORBERT WIENER,

Editorial Staff of The Americana.

PESTALOZZI, pès-tà-lôt'sè, **Johann Heinrich**, Swiss educational reformer: b. Zürich, 12 Jan. 1746; d. Brugg, Aargau, 17 Feb. 1827. He was educated at the University of Zürich, and became a follower of Lavater (q.v.), to whose 'Memorial' he contributed. At the death of Bluntschli who was a friend of his, he became interested in educational matters. At the age of 23 he married. The perusal of Rousseau's 'Emile' filling him with dislike for the habits of a learned life, and for the general system of education in Europe, he turned his attention to farming. He studied agriculture, and then in 1767 bought a piece of land near Birr, in Aargau, built a house, which he called Neuhof. He became acquainted with the moral wretchedness of the lowest classes, and in 1775 began his career of instruction by the admission of the children of paupers into his house, turning his farm into a kind of asylum or industrial home. But his philanthropic and noble self-denial was derided, his confidence was abused, his own affairs declined, he was generally considered as a well-meaning enthusiast and his enterprise failed in 1780. Nevertheless, amid straitened circumstances he collected that knowledge of the state of the lower classes so admirably set forth in his novel 'Lienhard und Gertrud' (1781-85), a work which exerted a remarkable influence. This book details the influence for good of a high-minded woman at home and in the village. Other writings of his are alike numerous and important, and contain further elucidations of his principles. In 1798 he established a school at Stanz for refugees from the French invasion, but circumstances obliged him to abandon it, and he then took charge of a school at Burgdorf, where he also

received pupils who paid for their instruction, so that he was enabled to employ able assistants. In 1802 he went to Paris as a deputy, and unsuccessfully tried to interest Napoleon in a plan for national education; in 1805 he removed his school to Yverdum, in the Pays de Vaud, where he occupied the castle given to him by the government. The grand principle of Pestalozzi's method was that of communicating all instruction by direct appeal to the senses and understanding, and forming the child by constantly calling all his powers into exercise, instead of making him a mere passive recipient, selecting the subjects of study in such a way that each step should best aid the further progress of the pupil. The principles of his method are clearly developed in his 'Wochenschrift für Menschenbildung.' The value of these principles, as well as the esteem in which they are now held, may be gathered from the fact that they are substantially at the basis of the normal school system of Europe. Pestalozzi was a poor organizer, manager and teacher; but he originated and gave the impetus to the ideas of social reform by education so prominent in the 19th century. Among his works were 'The Evening Hours of a Hermit' (1780); 'How Gertrude Teaches her Children' (1801); 'The Swan's Song' (1826). The best known of his many disciples is Fröbel. Consult 'Life and Works' by De Guimps (1880), and 'Life' by Pinloche (1901).

PESTH. See BUDAPEST.

PESTILENCE, general term for diseases of epidemic character in which a large proportion of the population of a district or country is affected and in which there is a high rate of mortality. Within historic times the term has been used to designate successively smallpox, erysipelas, syphilis, the bubonic plague, yellow fever, etc., which at different times have devastated whole countries and continents, e.g., the Black Death, now known to have been the bubonic plague. See PLAGUE.

PÉTAİN, pā'tān, Henry Philippe, French general; b. April 1856. Educated at Saint Cyr and the École Supérieure de Guerre, he rose to general staff rank and in 1901 was appointed a professor at the latter school. At the outbreak of the European War he was a colonel on the retired list, but was immediately placed in command of a brigade. During the fighting and retreat at Charleroi he beat off some furious attacks by overwhelmingly superior enemy forces. His skilful withdrawal of the brigade from an untenable position led to his being placed at the head of a division, which he commanded at the first battle of the Marne. Like General Foch, who had also been a military professor, Pétain found the occasion to put his classroom theories to a practical test that proved a decided success. Within a few weeks, while still wearing his colonel's uniform, Pétain was a general in command of an army corps, and during the first offensive in May 1915, in the Artois sector, he took some 10,000 prisoners and numerous guns from the enemy. In the Champagne battles of September he commanded the Army of Reserve and greatly distinguished himself in the capture of the Hindenburg Line. In February 1916, when the great German attack on Verdun opened, General Pétain was placed in command of the armies

defending the historic fortress, in succession to General Balfourier. He arrived at Verdun on the fourth day of the battle; four miles of ground had been lost, and with it gun positions which made the task of the defense almost impossible. The crisis came the same evening; the German assault on the two miles of the Douaumont front reached a pitch of unprecedented violence. It was the culmination of the German effort, the last blow before which the fortress was to crumble. The Kaiser was watching through his glasses and victory was already taken for granted. That same night tidings were flashed to Berlin that Douaumont, the key of the last defense line of Verdun, was in German hands. The next morning, 26 Feb. 1916, Pétain launched the counter-attack and drove the invaders back. In April he was appointed to one of the three group commands, the central *Secteur*, from Soissons to Verdun, while General Nivelle continued the defense of Verdun. In December 1916 Pétain was raised to the dignity of a marshal of France; in April 1917 he became chief of the staff, and on 15 May 1917 was appointed commander-in-chief of all the French armies on the western front. His tenure of that responsible post was remarkably free from those "regrettable incidents" that at times marked the disunited efforts of the Allies. On the unification of all the commands under General Foch in April 1918, Marshal Pétain received a staff appointment. See WAR, EUROPEAN—MILITARY OPERATIONS ON THE WESTERN FRONT.

PETAL, one of the leaf-like parts of the corolla of a flower. See COROLLA; FLOWER.

PETALESHARO, pêt-ălësh-á-rō, Pawnee chief of the Skidi band. He made himself famous by rescuing from sacrifice a young girl captive from the Sioux tribe with which the Pawnees were at war. As she was being led to the place of sacrifice Petalesharo seized her, flung her upon a horse and springing upon another eluded pursuit and carried her near enough to her own people for her to be safe from pursuit. He then daringly returned to his tribe and faced their anger with such intrepidity that his conduct went unpunished. Later he succeeded in abolishing the practice of human sacrifice and upon his visit to Washington in 1821, acting as a delegate from the Pawnees, he was the recipient of much attention and was presented with a medal in recognition of his service to humanity.

PETALUMA, pêt'a-loo'ma, Cal., city of Sonoma County, on the Petaluma River and on the Northwestern Pacific and the Petaluma and Santa Rosa railroads, 35 miles north of San Francisco. It contains a fine plaza and park, a public library, flour and silk mills, foundries, machine shops, engine works, cheese factories, tanneries, planing mills, etc. Pop. 6,226.

PETARD, pět-tárd, in ancient warfare, a bell-shaped engine, made of gun-metal, loaded with from 9 to 20 pounds of powder and then exploded. It was employed to break down gates, bridges, barriers, etc., to which it was hung by means of a wooden plank attached to it. It was also used in countermines to break through the enemy's galleries.

PETAIVIUS, pe-tá'vī-ūs, Dionysius or Denys Pétau, pā tō, French theologian; b. Or-

leans, France, 21 Aug. 1583; d. Paris, France, 11 Dec. 1652. He was educated at Orleans and at Paris pursuing with avidity the studies of mathematics, belles-lettres and philosophy in particular. In Paris he became an intimate friend of Isaac Casaubon (q.v.). In 1602, when but 19 years of age, he was appointed to the chair of philosophy at the University of Bourges. He resigned in 1605 to enter the order of the Jesuits. He instructed in rhetoric at Rheims in 1609; at La Flèche in 1613; and at the College of Paris in 1618. Subsequently he studied theology at the College of Pont-à-Mousson and in 1621 accepted the position of professor of theology at the University of Paris, which he occupied 22 years. After 1646 he gave up teaching and devoted himself entirely to literature, completing 49 books dealing with philosophy, history and theology, which give him rank as one of the greatest scholars of the Jesuit order. It has been claimed for him that he was the restorer of dogmatic theology. His chief work, 'Opus de Theologicis Dogmatibus' (5 vols., 1644-50), was uncompleted at his death. He published annotated editions of 'Synesius' (1612); 'Themistius' (1613); 'Julian' (1614); 'Nicephorus' (1616); 'Epiphanius' (1622); etc., besides his historical and theological works, among which are 'Opus de Doctrina Temporum' (1627); 'Uranologion' (1630); 'Rationarium Temporum' (1633).

PECHORA or **PETCHORA**, *pech-ō'ra*, a river of European Russia, which rises in the north of the government of Perm, on the western slope of the North Ural Mountains; flows almost due west, then turns north across the eastern part of the government of Vologda, enters the government of Archangel and on reaching lat. 66° N. makes a long curve southwest to long. 52° E., when it turns abruptly due north and enters Pechora Bay by a great number of channels through a broad delta. Its total course is about 980 miles, of which 730 miles are navigable. Its upper reaches are frozen for six months in the year and the lower stretches for nearly five months. Its principal affluents are the Izhma from the south and the Ussa from the east.

PETECHIÆ, *pě-těk'ī-ě*, small, purplish or crimson spots which appear on the skin in certain diseases. They are caused by hemorrhage into the subcutaneous tissues. These spots are well defined and of variable size. They are not raised above the surface of the skin and do not fade on pressing. They may be symptoms of purpura or scurvy and are sometimes seen in scarlet fever, measles and in that form of smallpox called varioloid. When large, these spots are sometimes called ecchymoses.

PETER, Saint. See SAINT PETER.

PETER I (the Great), Alexeievitch, emperor of Russia: b. near Moscow, 9 June 1672; d. Saint Petersburg, 8 Feb. 1724. He was the son of the Tsar Alexei or Alexis Mikhailovitch. His elder brothers, Fedor and Ivan, were feeble in constitution. Fedor succeeded to the throne as Fedor III in 1676, and died in 1682. An attempt was then made to have Peter assume the imperial dignity with his mother, the Tsarina Natalia Kirillovna, as regent. This arrangement did not please Sophia, the third daughter of Alexis, who had hoped to reign in

the name of her feeble brother. She roused the Strelitz, or bodyguard, and had Ivan proclaimed tsar jointly with Peter, and herself regent. Peter gave early proof of capacity, and under the guidance of the Genevese Lefort took enthusiastically to the study of military science. In 1689 he married Eudoxia Fedorovna, who belonged to a powerful family, the Lapuchin. This alliance enabled him openly to oppose his sister, and in the course of this year he succeeded after a brief struggle in wresting the power from her. She was confined in a convent, where she died in 1704. Peter was now virtually sole emperor, though, till the death of his brother in 1696, he associated the latter's name with his own in the ukases of the empire. With the assistance of Lefort and Patrick Gordon he began to organize his army; but his great ambition was to form a navy. He went himself to Archangel, and cruised on board Dutch and English ships. He brought Dutch and Venetian shipbuilders to Russia, and sent Russians to Venice, Holland and Leghorn to learn shipbuilding. At length a fleet, which he had constructed, enabled him to conquer Azof from the Turks. His reforms excited great opposition among the old Russian party of the nobility. A few years after his marriage he repudiated his wife for the encouragement she gave the reactionary party. In 1697 he suppressed with great barbarity a revolt of the Strelitz. Leaving his capital under the military command of Gordon, he then proceeded on that remarkable tour through Europe, in which his vast designs for the improvement of his people first began to appear. He formed an extraordinary embassy to Holland, which he accompanied incognito. After working some weeks in an Amsterdam shipyard he took up his residence in August at Saardam, a famous shipbuilding port, and for several months worked for wages as a ship-carpenter under the name of Peter Michaeloff. Here for a time he lived alone in a little hut, meanwhile keeping up a correspondence with his ministers of state at Saint Petersburg. In 1698 he spent about three months in a similar manner in England, where he worked in a Deptford dockyard; and here also, as in Holland, he procured a great number of sailors and artificers, as well as engineers, for a great canal which he projected between the Don and the Volga. He afterward visited Vienna, where he particularly acquainted himself with the organization of the army. He was about to proceed into Italy, when he received intelligence of another revolt of the Strelitz, upon which he returned home, and through Gordon repressed the revolt, savage vengeance being taken on the insurgents. Peter organized his army on the German model; served himself in it as a private soldier, and worked his way up through all the subordinate grades before he received a commission, an example which he compelled the young nobles to imitate. He obliged his subjects to adopt European costume by taxing their long Tartar robes; emancipated the women from Asiatic seclusion; reformed the calendar; committed the charge of the public revenue to a regular administration; and made himself virtually the head of the Church. He founded schools of navigation and mathematics, brought cattle and herds from Silesia, called into his dominions

foreign artisans of all kinds, established manufacturing of arms, tools and fabrics, and distributed metallurgists through the mining districts of Russia. Such were the peaceful occupations of his whole reign; but he was not satisfied till he had given Russia a sea-board, and this could only be done at the expense of Sweden. Accordingly in 1700, when he thought his army was ready, he joined Denmark and Poland in a league against Charles XII (q.v.). His defeat at Narva, 30 Nov. 1700, and other early reverses, did not discourage him. In two following campaigns he gained some advantages over the Swedish generals, and 27 May 1703 his conquests enabled him to accomplish his great object by laying the foundation of Saint Petersburg on the Neva. The decisive victory of Poltava, 8 July 1709, confirmed and extended his conquests; but the war dragged on until 1713, and Turkey becoming involved in it he nearly threw away all his successes by allowing himself to be hemmed in by the Turkish army on the Pruth. The empress Catharine I (q.v.), whom he had married secretly in 1706, and publicly in 1710, opened negotiations with the grand vizier, and procured a peace, with the relief of the Russian army, for the surrender of Azof and some small forts on the Black Sea. Not satisfied, however with all his temporal power, Peter had suppressed the patriarchate and declared himself head also of the church. In 1713 Peter transferred the senate from Moscow to Saint Petersburg. His eldest son, Alexis, was in open sympathy with the reactionary party. Peter had him tried for conspiracy and condemned to death, 5 July 1718. He died in prison 7 July. The Peace of Nystadt with Sweden was signed in 1721. By its terms the tsar retained nearly all his conquests, including Livonia and Esthonia. He relinquished Finland, and paid to Sweden about \$2,000,000. The senate after this peace conferred on him the title of emperor of all the Russias, to which were added the epithets of the Great and Father of His Country. In 1724 Peter founded at Saint Petersburg the Academy of Sciences, which was not, however, opened until 1726. In spite of the great material services Peter rendered to his country he remained to the last a man of coarse tastes and brutal propensities, addicted to the lowest vices and ferocious cruelties. His death followed a period of the severest suffering. The empress was declared his successor. The so-called Testament of Peter the Great, defining his political policy, was probably written at the order of Napoleon I. Consult Motley, J. L., 'Peter the Great' in Harper's Half-hour Series (New York 1877); Brückner, A., 'Peter der Grosse' (Berlin 1880); Minzloff, R. J., 'Pierre le Grand dans la Littérature Etrangère' (Saint Petersburg 1872); Schuyler, E., 'Peter the Great, Emperor of Russia' (2 vols., New York 1884); Browning, R., 'Peter the Great' (London 1898).

PETER II, Alexeievitch, Russian emperor, grandson of Peter the Great: b. Saint Petersburg, Russia, 22 Oct. 1715; d. there, 9 Feb. 1730. Orphaned in his childhood, he was sequestered by those in authority, and was rescued by a coterie of the nobility who prevailed upon his grandmother, Catharine I, to will him the throne. There is much doubt as to whether the will later produced was legal, but

on the strength of it Peter was proclaimed emperor, 18 May 1727. During his brief reign he was controlled by Mentchikof, who endeavored to marry the 13-year-old emperor to one of his daughters. In this he was frustrated by his rival, Dolgoruki, who also wished to ally his family with the imperial one. Dolgoruki took him to Moscow, and there he was crowned 25 Feb. 1728. The intrigues of the several factions came suddenly to naught upon the death of the emperor from smallpox in 1730. Anna Ivanova succeeded to the throne.

PETER III, Feodorovitch, emperor of Russia, grandson of Peter the Great, son of Anna Petrovna and Duke Karl Friedrich: b. Kiel, 21 Feb. 1728; d. Ropscha, 17 July 1762. Succeeding his father as Duke of Holstein, he bore the name Karl Peter Ulrich. In 1742 he was appointed grand-duke and heir-apparent by his aunt, the Empress Elizabeth, the direct male line having failed with Peter II. Three years afterward he married Sophia Augusta, Princess of Anhalt-Zerbst, later the Empress Catharine II (q.v.). He succeeded Elizabeth 5 Jan. 1762; immediately concluded a peace with Frederick II of Prussia, restoring the parts of Prussia conquered by Russia and sending 15,000 Russian troops to join Frederick's army; and in general showed himself so devoted to German ways of living, and so enamored of Frederick of Prussia, that the nobles soon rose against him. His wife, Catharine, already accused of adultery, joined the conspiracy, in which her lover Orloff and his brother (see ORLOFF) also took part, and 8 July 1762 was proclaimed empress. Peter offered to retire to Holstein, but he was forced to abdicate and then was assassinated by the conspirators. Consult Bain, R. N., 'Peter III, Emperor of Russia' (Westminster 1902).

PETER I, called **KARAGEORGEVITCH** as grandson of Karageorge or Czerny George, king of Serbia: b. Belgrade, 29 June 1844; d. there, 16 June 1921. His father, Alexander Karageorgevitch, ousted Michael Obrenovitch in 1842, but in 1858 was exiled by the returning Obrenovitch dynasty. Peter was educated in Russian military schools and at Saint Cyr; fought in the Franco-Prussian War, being thrice captured; furthered the Herzegovinian rising in 1875; married Zorka, princess of Montenegro, in 1883 and lived at Cetinje until her death in 1890. He then resided quietly in Geneva until June 1903, when he was proclaimed king of Serbia by the army officers who had killed King Alexander Obrenovitch and Queen Draga. His elevation to the throne was received coldly by most of the nations. His reign was signalized by the shaking off by Serbia of Austrian influence; by Austria's attack on the kingdom on 28 July 1914, which resulted in the general European War, and, in 1918, by the union of the Austro-Serbian, Croatian and Slovenian parts of the former Austro-Hungarian monarchy with Serbia to form the Serb, Croat and Slovene state (Jugo-Slavia), to which on 1 March 1921 Montenegro was added.

PETER, Epistles of. First Peter, Historical Attestation.—Two letters appear in the New Testament with the name of Peter as author. The early testimony that the first of these Epistles was written by him is unusually early and strong. It has often been re-

peated that except 1 John no other of the Catholic Epistles is so strongly attested in early Christian literature.

Objections to Petrine Authorship.—Many critics have, however, doubted for various reasons that Peter was the author of 1 Peter. (1) It is objected that there exists a dependence on the Epistles of Paul which cannot be attributed to Peter. Certainly, as is now generally recognized, this Epistle shows acquaintance with and use of both Romans and Ephesians, but it is not so generally admitted that this fact precludes Petrine authorship. On the other hand, it may fairly be said that nothing which we know of Peter justifies us in holding that he was an original thinker, and there seems to be no decisive reason why he might not have made such use of Paul's writings as is here made. The same may be said as to the more indefinite assertion that the theological conceptions may be denominated Pauline. It is easy to exaggerate the difference between the preaching of Paul and of the earlier Apostles; indeed, there is no reason to suppose that any fundamental differences existed between the two. In fact it is simpler to explain the relations to Pauline language and thought on the basis of the genuineness of the letter than otherwise. (2) Further objection is made to Peter's authorship on the ground of the lack of personal reminiscences of the life of Jesus. In answer, it is argued that it is unfair to set up any standard as to what material a man shall use in writing, and that the story of the ministry of Jesus which we find in the Gospels is not to be regarded as the substance of Apostolic preaching. In fact there are a number of slight expressions, too subtle to be the work of a forger, which show the familiarity of an eyewitness with the ministry of Jesus, and there are a much greater number of parallels with his teaching. (3) It is also urged that the conditions of the Christians addressed, especially in regard to persecution, require a date later than must be set for the death of Peter. But, in answer, it is said that Peter might have lived to a time later than the Neronian persecution, and by others that the conditions implied may reasonably be held to have already existed in the time of Nero. (4) Another difficulty is made out of the fact that the language and style of the Epistle is better than can reasonably be attributed to the Galilean Apostle. It is answered that as Greek was commonly spoken in Galilee in the time of Christ, Peter may have used it familiarly from his boyhood and have improved in his use of the language during the years of his Apostolic travels. But it is not necessary to credit Peter alone with this Epistle, since the connection of Silvanus with it (v, 12) is consistent with the view that he aided in putting the letter in shape, if, indeed, the phrase does not require this supposition. In view of these and similar considerations the great majority of scholars hold strongly to the traditional Petrine authorship.

Persons Addressed.—Those to whom the letter was sent were addressed (i, 1) as members of the "Dispersion," the Jewish name at that time for those Jews who lived outside of Palestine, but various statements in the body of the letter so clearly imply that the readers were of Gentile origin that it is agreed that the

word "Dispersion" is used figuratively, not literally. These readers are said in the same address to live in Pontus, Galatia, Cappadocia, Asia and Bithynia, the Roman provinces which covered practically the whole of Asia Minor.

Date and Place of Composition.—The date of the Epistle, if genuine, is, as has already been suggested, dependent on the conditions of the readers in regard to persecution and the date to be set for the death of Peter. While the argument of Ramsay for 80 A.D. is in many ways plausible, the majority of scholars still hold that it was written between 64 and 67. The majority also hold that "Babylon" given in v. 13 as the place of composition is used figuratively for Rome, in harmony with what is held to have been already Jewish usage, as it is shown by the Revelation to have later been Christian usage.

Contents.—While the plan of the letter is not very sharply defined, the contents may be briefly summarized as follows: I, 1-12, Introductory; I, a series of exhortations relating to the individual lives of the readers, to hope, holiness, reverential fear, love and desire for truth, i, 13-ii, 10; II, a second series of exhortations with regard to relations to others, the civil power, submission of slaves to their masters, husbands and wives, and duties in view of persecution, ii, 11-iv, 6; III, another series of varied exhortations touching the individual life, iv, 7-v, 9; the conclusion being a few personal words presumably in Peter's own handwriting and two brief prayers.

Character.—This letter is often called an "Epistle of hope." Its primary object seems to have been a message of encouragement to the persecuted Christians of the time. Von Soden characterizes it thus: "This simplicity of thought joined with intimacy of appeal, this lofty moral earnestness joined with joyous, indeed jubilant, hope—amid a prevailing atmosphere of trial and affliction . . . —all combine to make this short, impressive letter one of the most precious monuments of primitive Christianity, a jewel of the New Testament worthy to be inscribed with the name of the great Apostle."

Second Peter, Historical Attestation.—The second Epistle ascribed to Peter was not till late given an undisputed place in the Canon, and the authorship which it claims is more widely set aside than in the case of any other book of the New Testament. Eusebius reckons it among the "disputed" books, though this must not be taken to mean that he did not himself accept it. It is found in the Sinaitic and Vatican, our oldest manuscripts. In the 3d century it had found considerable acceptance, but the traces of its influence in the 2d century are comparatively scanty and uncertain.

Objections to Petrine Authorship.—Against its claim to be written by the Apostle Peter (i, 1), it is urged (1) that the author makes conspicuous endeavors to have it appear thus. Not only does the claim stand in the address of the letter, but also it is argued that the references to the first letter, to the Transfiguration, to the prediction by Jesus of Peter's death, all are introduced to substantiate this claim. In answer, it is argued that Peter certainly might have said all that is attributed to him. Attention is also called to the fact that

in many points there are somewhat striking differences between 1 Peter and 2 Peter, which an imitator would have been expected to avoid, as, for example, that in the opening address the very name of Peter appears in a form quite different from that in the first letter. (2) The unlikeness between the two letters in vocabulary and style is also urged against Petrine authorship. This should certainly be recognized to the full, but its significance is greatly lessened if the first letter is largely due, as many hold, to the aid of Silvanus. A difference in assistants might practically explain the whole difference in the letters, and at the same time it should be noted that certain subtle resemblances exist which need to be taken into account. (3) The unlikeness in the thoughts advanced is used as an argument that the two Epistles cannot be due to the same author. To this it has been answered that while the encouragements of 1 Peter are lacking, or, rather, are replaced by warnings, and while instead of "hope," which is the keynote of 1 Peter, "knowledge" is emphasized in 2 Peter, this may fairly be explained by the different conditions and needs of those addressed. (4) It is also urged that the errorists attacked must have belonged to the 2d century. But while doubtless there were such errorists in the 2d century, it can scarcely be demonstrated that such did not exist in the 1st century as well. To very many minds the Epistle of Jude, to which 2 Peter is according to general consent largely indebted, would demonstrate the early date of the evils combated. (See article JUDE, EPISTLE OF). (5) It has sometimes been insisted that an Apostle could not have used the material of Jude as did the author of 2 Peter. But such assertions are unsafe. It is at least conceivable that Peter, recognizing the importance of the warnings of Jude, might have given them the weight of his authority. (6) It is further held that some phrases, as "your Apostles," the reference to Paul's Epistles as "Scripture," and the fact that some were disappointed at the delay of the expected end, all imply a later date than would be consistent with Peter's authorship. But many thoughtful scholars do not feel that this is a necessary inference. (7) It is also urged that the Epistle as a whole is unworthy of the Apostle Peter. But there seems to be of late an increasing recognition that, even though not a great creative work, it yet deserves what Calvin said of it: "Since the majesty of the Spirit of Christ exhibits itself in every part of the Epistle, I feel a scruple in rejecting it wholly." Many scholars of the first rank still accept the Petrine authorship, and many who do not accept it would also not characterize the book as a forgery. On the contrary, they would insist that for the author to give the name of Peter to his work was not dishonestly intended, but was instead a literary device not uncommon at the time nor to be regarded as discreditable when judged as it should be by the standards not of our age but of his own.

Circumstances of Composition.—If genuine, it cannot be later than 80 in any case, or than 66 if Peter perished in the Neronian persecution, and the place of composition would naturally be Rome if the earlier date is accepted, but would be wholly uncertain with

the later date. If not genuine, the date might fall almost anywhere between 80 and 130, but the language of the Fathers would seem to show that it was composed not later than the first quarter of the 2d century, and it might well have been before 100. The place would then be wholly a matter of conjecture, as would the special evils which it was its purpose to correct.

Contents.—After a brief address, i, 1, 2, the author exhorts to growth in the Christian life to full knowledge of Christ, i, 3–11; then justifies his reminders by the Divine testimony at the time of the Transfiguration, i, 12–20; denounces the false teachers and warns of doom, ii, 1–22; and makes a final appeal to his readers based on the coming destruction of the world, iii, 1–18.

PETER, Order of. See ORDERS, ROYAL.

PETER OF BLOIS, blwā, English prelate: b. Blois, 1135; d. about 1208. He received his education at Paris and Bologna; became tutor to William II of Sicily and keeper of the royal seal. In 1173 he entered the service of Henry II of England, by whom he was dispatched on missions to Paris and Rome. In 1176 Peter became secretary to the archbishop of Canterbury. From 1191 to 1195 he was secretary to Queen Eleanor. He was one of the most learned men of his time. He wrote several works of which the 'Epistles' (Brussels 1480) is the most important.

PETER CLAVER, Saint, Spanish Jesuit missionary: b. at Verdu in Catalonia 1580; d. Cartagena, New Granada, South America, 8 Sept. 1654. He entered upon his novitiate in the Society of Jesus at Tarragona in 1602, and upon the establishment of a province of his order in New Granada he was sent to Cartagena as missionary to the negroes in 1610. After two years of further study in the College of Santa Fé de Bogota, he was ordained priest; and from that time labored heroically for 44 years in behalf of the blacks. Bearing food and medicines he visited the slavers immediately upon their arrival in Cartagena harbor, and when the negroes had been landed, instructed them, organizing a band of catechists for the purpose; directed their care in the hospitals; obtained for them humane treatment by their owners; regularly conducted for such as remained in Cartagena services in the Jesuit Church; and extended his labors widely among the mines and plantations of the province. Unable to suppress the slave trade, he labored ceaselessly to mitigate its cruelties through a noble ministry to its victims. He was beatified by Pius IX 16 July 1850 and canonized by Leo XIII 15 Jan. 1888. Consult the lives by

Schelkle (1833; a translation into German of the work by the Jesuit Fleurian); and Höver (1888). Also de Andrada, F., 'Lives of the Saints' (Madrid 1657).

PETER THE CRUEL, king of Castile and Leon. See PEDRO THE CRUEL.

PETER THE HERMIT, preacher of the first crusade: b. diocese of Amiens about 1050; d. Neufmoutier, near Huy, 8 July 1115. Many fictitious stories, have been given of his early life. It is generally believed that he had been a French military officer, and that he made a pilgrimage to Palestine about 1093 but did not actually reach the Holy City, owing to the dangers encountered. He is reported to have made a journey to Rome and by some is credited with having proposed the Crusades to Pope Urban II, who is generally regarded as their author. After the Council of Clermont (see CRUSADES), he preached the crusade in central and northern France, everywhere arousing unprecedented enthusiasm. He journeyed about on mule-back, clad in a hermit's robe, and bearing in his hand a crucifix. Wherever opportunity offered he urged the cause. The success of his enthusiastic harangues was proportionate to the boldness of his scheme and the ignorance of his auditors. Peter himself led the way through Hungary at the head of the first undisciplined multitude of more than 30,000 men, a comparatively small number of whom survived to reach the city. He preached on the Mount of Olives 8 July 1099, took part in the capture of Jerusalem (15 July); and, having witnessed the accomplishment of his undertaking, returned to his native country, where he founded the abbey of Neufmoutier and died its prior. Consult Donnet, F., 'Pierre l'Hermite et la Famille L'hermite d'Anvers' (Antwerp 1893).

PETER IBBETSON. The novel which first brought to George Du Maurier fame as a writer of fiction. Its success led to the writing of the two other novels, 'Trilby' and 'The Martian,' which complete the author's major literary achievement. It is important to remember that these works were produced as a venture, by one who was not a professional writer. Du Maurier was an artist, and first became famous as an illustrator of *Punch*. In 1859, at the age of 25, he suddenly lost the sight of one eye as a result of detached retina. When the sight of the other eye became uncertain, he lived under the fear of becoming unable to earn his living by the prosecution of his regular work. He therefore turned to writing. About 1891, encouraged by Henry James, Du Maurier wrote 'Peter Ibbetson' for Harper and Brothers. The story was published serially in *Harper's Magazine* in 1891 (June to November numbers inclusive), and was later issued in book form. Three factors contributed to the success of the work. First, the scenes of the story are those of Du Maurier's own early life, and over the whole narrative, particularly over the early chapters, there hangs a truly delightful atmosphere of reminiscence. Certainly, few readers can resist the appeal of Du Maurier's narrative of young Peter's journey from London to Paris—from "a dingy house in the heart of London in a long street of desolating straightness that led to a dreary square and back again," to Passy, the suburb of

Paris, where he awoke to find himself "on a beautiful June morning in a charming French garden, where the warm, sweet atmosphere was laden with the scent of lilac and syringa, and gay with butterflies and dragon-flies and humblebees." Second, the supernatural element attracted many readers. The action of the story centers about the ability of Peter Ibbetson and Mary, Duchess of Towers, to live in the world of dreams a life entirely apart from their actual life. Lastly, Du Maurier illustrated his own story with the skill which only a gifted artist can summon. The least artistic feature of the novel is the handling of the supernatural element. The delicate feeling evidenced in the autobiographical portion constitutes the chief charm of the story, and will keep the work alive for a long time. 'Peter Ibbetson,' like 'Trilby,' has been successfully dramatized.

WALDO H. DUNN.

PETER LOMBARD, or **PETER THE LOMBARD**, Italian theologian: b. at Lumello, Lombardy, about 1100; d. 1164. He was educated at Bologna, Rheims and under Abelard at Paris. He became professor of theology in the Notre Dame School and was made bishop of Paris in 1159. After a year in charge of the see he resigned. He compiled 'Sententiarum Libri IV,' collected from the works of Saint Augustine and other doctors of the Church Consult Harnack, A., 'History of Doctrine' (Eng. trans., Boston 1899); De Ghellinck, 'The Book of Sentences' (in *Dublin Review*, 1910); Protois, 'Pierre Lombard, son époque, sa vie, ses écrits, son influence' (Paris 1881).

PETER MARTYR, Protestant divine: b. Florence, 1500; d. Zürich, 1562. As Pietro Martire Vermigli, son of Stefano Vermigli, he entered at 16 the order of the regular canons of Saint Augustine, at the monastery of Fiesole. In 1519 he removed to Padua, where he studied Greek and philosophy. In 1526 he commenced to preach, and attracted great applause in several cities of Italy. For a time he was prior of Saint Frigidian's at Lucca. After receiving numerous important offices in his order his religious opinions were considered as savoring too much of the doctrine of the reformers, Luther and Zwinglius. At length he renounced Roman Catholicism, and it became necessary for him to quit Italy. At Zürich, in Switzerland, he was received in a friendly manner by the Protestant clergy (1542). Soon after he became professor of divinity at Strassburg, and in 1547 accompanied Bucer, Fagius and other learned reformers, on the invitation of Archbishop Cranmer, to England, where he was made professor of divinity at Oxford and canon of Christchurch. Martyr had followed the example of Luther in marrying a nun who had renounced her vows. He was appointed to the theological chair at Oxford in 1549, and became a very efficient assistant to the English reformed clergy in carrying on their plans of innovation in the Church. On the accession of Queen Mary, being commanded to quit the country, he returned to Strassburg and resumed his former situation. In 1556 he removed to Zürich to occupy the office of professor of theology. In 1561 he assisted at the famous conference between the Catholics and Protestants held at Poissy, in France. He was the author of many works on theology and com-

mentaries on the books of both the Old and the New Testament.

PETER PAN, a play for children written by Sir James M. Barrie in 1904. In 1905 it was produced in New York, Miss Maude Adams assuming the principal rôle.

PETER PARLEY. See GOODRICH, SAMUEL GRISWOLD.

PETER-PENNY, or **PETER-PENCE**. See PETER'S PENCE.

PETER SCHLEMIHLS WUNDER-SAME GESCHICHTE. 'The Wonderful History of Peter Schlemihl' by Adalbert von Chamisso — first published in Germany in 1814, in the United States in English translation in 1825 — is one of the most famous fairy-tales of German Romanticism. The fundamental idea, that a man can lose his shadow, Chamisso probably took from folk-lore and he made it a fascinating means of putting the reader in an atmosphere hovering between the real and the fantastic. The meaning which Chamisso gave to the shadow seems to be social repute, which men imperatively demand of each other without testing it for its true value. Schlemihl, a Hebrew name, originally meaning friend of God, Theophilus, was also used euphemistically by the Jews for a man who is denied all success in the world. Our Peter Schlemihl exchanges his shadow for the gold sack of Fortunatus, but only to fall a victim to unhappiness very soon, since men withdraw from him on account of his defect and he himself becomes involved in guilt. Yet when the devil wants to return his shadow to him in exchange for his soul, Schlemihl, as the friend of God, rejects the proposal and throws away the magic gold sack besides. He seeks refuge in nature and travels about the world in seven-league boots. When overtaken with sickness he is reconciled with his fellow-men who take care of him and in his sickness do not look for his shadow. Finally, however, he returns to his studies of nature and finds his deepest satisfaction in communion with her and his own better self.

Undoubtedly 'The Wonderful History of Peter Schlemihl' contains features and experiences of Chamisso's own, but the poet himself protested against carrying the comparison between him and the hero of his story too far. Consult edition in 'Deutsche National-Literatur' (1882-98, Vol. 148, with excellent introduction and references); English translation in 'German Classics' (Vol. V).

EWALD EISERHARDT.

PETER SIMPLE, a tale of life on the sea, told in his best vein by Captain Marryat and first published in 1834.

PETER THE VENERABLE, Abbot of Cluny: b. Montboissier, about 1092; d. Cluny, 25 Dec. 1156. He was educated in a monastery of the Cistercians, and entered the monastery of Cluny in 1111. In 1122 he became abbot there and for 35 years exerted a powerful influence for good in the West. In 1134 he attended the Council of Pisa and brought about a recognition of Innocent II as the legitimate Pontiff. To Abelard, Peter gave a refuge in the closing years of the former's life. Peter was a scholar of great ability. He caused a translation of the Koran to be made, which for many years was the only one in existence, and

wrote several treatises including those 'Against the Jews'; 'Two Books of Miracles,' and 'Against the Saracens.' For these and his other works consult Migne, 'Patrologia Latina' (Vol. CLXXXIX). Consult also Demimied, 'Pierre le Vénérable' (new ed., Paris 1895); d'Avenel, J., 'Vie de Pierre le Vénérable' (ib. 1874); Wilkens, C. A., 'Petrus der Ehrwürdige' (Leipzig 1857).

PETERBORO, N. H., town in Hillsborough County, on the Boston and Maine Railroad, 40 miles southwest of Manchester. It has a public library, a historical society, basket factories, cotton mills, etc. In recent years groups of arcraft workers, art and music students have established colonies in Peterboro. The town owns the water-supply system. Pop. 2,615.

PETERBOROUGH, pē'tēr-būr-ō, **Charles Mordaunt**, 3d EARL OF, English soldier; b. about 1658; d. Lisbon, Portugal, 25 Oct. 1735. He succeeded to his title and estate in 1675, went to Holland in the reign of James II, and, entering into the scheme of his dethronement, returned to England with William III, by whom he was created Earl of Monmouth. He succeeded to the earldom of Peterborough in 1697, and in 1705 was employed as joint-commander with Sir Cloudesley Shovel of the English army in Spain, in the War of the Spanish Succession. In 1710-11 he was appointed ambassador to Turin and other Italian courts, and in 1712 governor of Minorca. In 1722 he was made general of the marine forces of Great Britain. Lord Peterborough was intimate with his literary contemporaries, and was himself a writer of verse. He figures as Lord Ormont in George Meredith's novel, 'Lord Ormont and His Aminta.' Consult Warburton, 'Memoirs of Charles Mordaunt' (1853); Russell, 'Memoir of Charles Mordaunt' (1887); Stebbing, 'Peterborough' (1890).

PETERBOROUGH, Canada, a port of entry and county-seat of Peterborough County, Ontario, on the Otonabee River and Trent Valley Canal, and on the Grand Trunk and Canadian Pacific railways, 75 miles northeast of Toronto. The city is well laid out with wide and regular streets, and has a city hall, post office, customs and inland revenue buildings, mechanics' institute, normal school, collegiate institute, 11 other schools, 13 churches, a Young Men's Christian Association building, Young Women's Christian Association building, a public library, hospitals, banks and daily and weekly newspapers. A United States consular agent is resident here. Peterborough is the centre of a rich agricultural region. It exports lumber, peas, oats, barley, wheat, flour, leather, furs, cheese, wool and pork. The manufactures include steam-engines, agricultural implements, mill machinery, foundry products, furniture, fur garments, harness, boats, electrical machinery, mining machinery, laundry machinery, bricks and tiles, aerated water, silk labels, pianos, locks, canoes, flour, quaker oats, cream separators, dairy supplies, steel window sashes, marble, yarn, carpets, women's and children's dresses, and mattresses. There are saw and planing mills, electrical and carbon works. A hydraulic lift-lock, the largest of its kind in the world, designed to lift vessels 140 feet long

to a height of 65 feet in one movement, was completed at Peterborough in 1904. (See CANADIAN CANALS). There are now 50 miles of water mains, 40 miles of concrete sidewalk, five miles of asphaltic concrete pavement, and 30 miles of sewers in the city. The waterworks system, electric distribution system, garbage disposal plant and sewerage system are owned and controlled by the city. The city is the headquarters for Canadian General Electric Company, De Haval Dairy Supply Company, Vermont Marble Company for Canada, Quaker Oats Company for Canada. Pop. (1921) 20,989.

PETERBOROUGH, England, an episcopal city, in the county and 43 miles north by east of the town of Northampton, mainly on the left bank of the Nen. It is the railway centre of a large agricultural district; its corn and stock markets and its manufactures of agricultural implements are of great importance. The principal building is its cathedral, founded by Penda, son of Penda, fourth king of Mercia, in 655, and destroyed by the Danes in 870. Rebuilt in 966, in 1116 a great part of the edifice was destroyed by fire; in the following year its restoration was commenced; but not till the opening of the 16th century did the structure assume its present aspect. The prevailing character of the building is Norman, but it exhibits examples of transition, early English, decorated English and perpendicular styles. The most commanding feature is the west front, consisting of three magnificent pointed arches 80 feet high, surmounted by pediments and pinnacles, and flanked by turrets with spires and pinnacles. The whole front forms a square of 150 feet in height and breadth. Catharine of Aragon, wife of Henry VIII, was interred in this cathedral. The building has recently undergone extensive repairs and restorations. The minster precincts show the remains of a cloister, a fine perpendicular gateway leading to the deanery, a massive tower and gateway conducting to the bishop's palace, and an old chapel, now used as a museum. Other public buildings are seven churches, a number of Nonconformist chapels, the townhall, corn exchange, county court offices, several banks and a post-office. There is a training college for Church of England schoolmasters, grammar-school, middle-class school, etc. There are also an infirmary and dispensary and monastic almshouse. Pop. 33,574.

PETERHEAD, pē-tēr-hēd', Scotland, a seaport town in the county and 32 miles by road north-northeast of Aberdeen, on a peninsula, the most easterly point of Scotland, with a harbor on either side of it, communicating by a cut across the isthmus. A great harbor of refuge is being constructed by convict labor. The town has several churches, a town-hall with a spire 110 feet high, free library and museum, a market-cross, a customhouse, excellent schools, a convict prison, public baths, municipal lodging-house, etc. There are a woolen factory and granite-polishing works. The town has a considerable trade. The Greenland whale and seal fisheries, once of importance, have all but ceased; but the town is still an important centre of the herring-fishery. Some miles from the town are the ruins of the castles of Ravenscraig and Inverugie, the latter once the seat of the Keiths, earls-marischal of Scotland. There is at Peterhead a statue (presented to the town

by William I, emperor of Germany) of James Keith, field-marshal in the Prussian service, who was killed at the battle of Hochkirch in 1758. Pop. 13,559.

PETERHOF, pā'tēr-hōf, Russia, a town on the Gulf of Finland, 18 miles west of Petrograd and noted for an imperial summer palace built by Peter the Great in 1711. It contains a fine collection of paintings and is surrounded by beautiful parks and gardens laid out on the model of those at Versailles, with cascades, terraces and summer houses. Population estimated at 15,000.

PETERKIN, George William, American bishop: b. Clearspring, Md., 21 March 1841; d. 22 Sept. 1916. He was educated at the University of Virginia and at the theological seminary of Virginia. From 1861-65 he served in the Confederate Army, becoming first-lieutenant and adjutant to Gen. W. A. Pendleton of the Army of Northern Virginia. He then assisted his father in his duties at Saint James Church, Richmond, Va. (1868); was rector of Saint Stephen's Church, Culpeper, Va. (1869); Memorial Church, Md. (1873). In 1893 he organized a mission in Brazil, and in 1901 organized another in Porto Rico. He founded the Sheltering Arms Hospital in 1886. He was first bishop of West Virginia after 1878. Among his publications are 'Records of Protestant Episcopal Church in Western Virginia and West Virginia'; 'Handbook for the use of Members and Friends of the Protestant Episcopal Church,' and various other articles.

PETERMANN, pā'tēr-män, August Heinrich, German geographer: b. Bleicherode, Prussian Saxony, 18 April 1822; d. Gotha, 25 Sept. 1878. He learned his art at the Potsdam School of Geography. His first important work in cartography was a map for Humboldt's 'Central Asia.' In 1845 he went to Edinburgh and assisted Keith Johnston in the preparation of his 'Physical Atlas,' and in 1847 went to London, where he became a member of the Royal Geographical Society and contributed to the 'Encyclopædia Britannica,' etc. Queen Victoria appointed him 'Physical Geographer Royal.' In 1854 he became professor of geography at Gotha and superintendent of Justus Perthes' geographical establishment, editing for 14 years 'Petermann's Mitteilungen,' which he founded in 1855, the foremost among the geographical magazines. He traveled extensively in the Orient and wrote of his travels. He was associated with Hübner in important discoveries in chemistry and proofs of the atomic theory.

PETERS, pē'tērz, or **PETER**, Hugh, English Puritan Clergyman: b. Fowey, Cornwall, June 1598; d. London, 16 Oct. 1660. He was educated at Cambridge, took orders and preached with much acceptance at Saint Sepulchre, London, for a time but was presently imprisoned for non-conformity by Archbishop Laud. On being released he went to Rotterdam and from about 1632 was minister of an independent congregation there. In 1635 he came to New England and in December 1636 was ordained pastor of the First Church in Salem, Mass., in succession to Roger Williams, whose followers he excommunicated. In 1637 he was made an overseer of the newly established Harvard College. He proved himself to be a public-

spirited citizen, was active in civil and commercial affairs and in March 1638 was appointed to assist in collecting and revising the laws of the Massachusetts Bay Colony. He was sent to England in August 1641, with two others, to obtain revision of the laws of trade and excise, in which commission they were successful. Peters then joined the Parliamentarians, became a chaplain in the army, is said to have held a colonel's commission and was a valuable asset to the popular cause. He had intended to return to America, but various matters prevented and during the Protectorate he was a zealous supporter of Cromwell, on whose death he preached a sermon from the text 'My Servant Moses is Dead.' At the Restoration he was exempted from the Act of Indemnity, sent to the Tower and indicted for high treason as having been concerned in the death of Charles I. He was able to prove false the rumor of his having been present on the scaffold at the king's execution, but was found guilty of treason and was beheaded at Charing Cross. His private character, as was the fashion of the time, was the subject of much attack and the grossest immorality was charged against him, without any solid basis. He appears to have been honest and high-minded, but given to violent denunciations of his opponents and wanting in judgment. His writings are mainly political pamphlets and sermons. Consult Peters, Samuel, 'History of Hugh Peters' (1807); Felt, 'Memoir and Defense of Hugh Peters' (1851); and 'Dictionary of National Biography.'

PETERS, John Punnett, American Episcopal clergyman and archaeologist: b. New York, 16 Dec. 1852; d. there, 10 Nov. 1921. He was graduated from Yale A.B. in 1873; Ph.D. in 1876 and was a tutor there until 1879. He entered the ministry in 1876, studied in Berlin and Leipzig (1879-83), was in charge of Saint John's Church, Dresden, Germany (1881-83). He became professor of Old Testament languages and literature in the Episcopal Divinity School, Philadelphia, in 1884; of Hebrew, University of Pennsylvania in 1885 and was in charge of the expedition of that university which conducted excavations at Nippur (1888-91) unearthing the great temple of En-lil and discovering the oldest cuneiform inscriptions known up to that time, carrying back the records of civilization a millennium or more. In 1891 and again in 1901, he traveled and explored in Palestine. After 1893 he was rector of Saint Michael's Church, New York, was canon residentiary, Cathedral of Saint John the Divine (1904-10) and was active in civic and social work in New York City. He received the honorary degree of D.D. from Yale in 1895 and of Sc.D. from the University of Pennsylvania in the same year. He wrote 'Political History of Recent Times' (1883); 'Scriptures Hebrew and Christian' (English edition); 'The Bible for Home and School' (1886-89); 'The Bible as Literature' (1896); 'Nippur, or Explorations and Adventures on the Euphrates' (1897); 'Diary of David McClure' (1899); 'Archaeological History of Hither Asia' (1899); 'The Old Testament and the New Scholarship' (1901); 'Labor and Capital' (1902); 'Early Hebrew Story' (1904); 'Some Tombs in the Necropolis of Marissa' (1905); 'Annals of Saint Michael's' (1907); 'Modern Christianity'

(1909); 'Jesus Christ and the Old Commandments' (1914); 'The Religion of the Hebrews' (1914).

PETERS, pā'tērs, Karl, German explorer: b. Neuhaus, Hanover, Germany, 27 Sept. 1856; d. 17 Oct. 1918. He was educated in Göttingen, Tübingen, London, and Berlin. For a few years he devoted himself to teaching. In 1884 he founded the German Colonization Society and led an expedition to Central Africa, where he raised the German flag in Usagara, Ukami, Nguru and Useghu. He was granted the first Imperial Charter in German history; founded German East Africa in 1885; and continued his management of the colonial possessions until 1888, meanwhile annexing more territory in East Africa. In 1889-90 he led the German relief expedition in search of Emin Pasha and in 1890 reached Victoria Nyanza, after crossing which he met Emin Pasha with Stanley. In 1891-93 he was imperial high commissioner for East Africa and succeeded in establishing the boundary line between English and German possessions. He was attached to the colonial office of Berlin in 1893-95 and in 1896 was accused of cruelty in his treatment of the natives of Africa and recalled. The subsequent investigations resulted in his dismissal. He went to London, founded an exploration company, and in 1899-1901 explored the region between Zambosi and Sabi, where he made important discoveries of ruins which throw much light on ancient African history, and also found gold and copper mines. He has written extensively concerning his travels, his 'New Light on Dark Africa' has been published in nine languages and among his other publications are 'Willenswelt und Weltwille' (1883); 'Deutsch-national' (1887); 'Die deutsche Emin Pascha Expedition' (1891); 'Äquatorial und Südafrika nach einer Darstellung von 1719' (1895); 'Im Goldlande des Altertums' (1902); 'Forschungen swischen Sambeis und Sabi' (1902); 'England und die Engländer' (1905); 'Die Gründung von Deutsch-Ostafrika' (1906); 'Zur Weltpolitik' (1912); 'Afrikanische Köpfe' (1915).

PETERS, Madison Clinton, American Baptist clergyman: b. Lehigh County, Pa., 6 Nov. 1859; d. 12 Oct. 1918. He worked his way through school and college. At 16 he was a teacher, preaching on Sundays and lecturing through the week. For a year he attended Muhlenberg College, at Allentown, Pa., and then went to Franklin and Marshall College, Lancaster, Pa., and Heidelberg Theological Seminary, Tiffin, Ohio; entered the ministry of the Reformed Church in 1880, his first charge being in Indiana. He went from there to Ottawa, Ill., where he achieved a great reputation as a popular preacher. In 1884, when but 24 years of age, he was called to the Old First Presbyterian Church of Philadelphia. Here he increased his reputation, building up a regular congregation of 1,500. During the five years of his service there he lectured continually not only in Philadelphia but also in many distant cities. In 1889 he went to New York to become pastor of the Bloomingdale Church, Broadway, New York, where he remained for 11 years. He then adopted the Baptist faith and became pastor of the Sumner Avenue Baptist Church, Brooklyn, resigning in 1906. For two years

following he was pastor of the Church of the Epiphany in New York. Besides being a prolific contributor to newspaper syndicates he has published 'Justice to the Jew' (1899); 'Wit and Wisdom of the Talmud' (1900); 'Sanctified Spice' (1895); 'Why I Became a Baptist' (1901); 'The Man Who Wins' (1905); 'After Death — What?' (1908); 'The Mission of Masonry' (1913); 'Seven Secrets of Success' (1916); 'America for Americans' (1916); 'The Masons as Makers of America' (1917); 'All for America' (1917), and others.

PETERS, Richard, American jurist: b. near Philadelphia, 22 Aug. 1744; d. there, 21 Aug. 1828. He was educated in Philadelphia studied law and was admitted to the bar in 1763. In 1771 he became register of the admiralty but left this post at the breaking out of the Revolution and was appointed captain of a company of volunteers. In June 1776 he was appointed by Congress secretary of the board of war. On resigning this office in 1781 he was elected a Member of Congress for the term 1782-83. In 1787 he was member of the State assembly, and was its speaker from 1788 to 1790. In 1791 he was speaker of the State senate, and after the organization of the government he accepted in 1792 the office of judge of the United States District Court for Pennsylvania, a position which he retained for the rest of his life. The admiralty law of the United States may be said to owe to him its foundation. He was also eminent as an agriculturist, and was president of the Philadelphia Agricultural Society. His great estate of 200 acres, known as "Belmont," is now a part of Fairmount Park in Philadelphia.

PETERS, Samuel, American clergyman: b. Hebron, Conn., 12 Dec. 1735; d. New York, 19 April 1826. In 1757 he was graduated at Yale and traveled in Europe the following year. In 1759 he took orders in the Church of England in London and in 1762 took charge of churches in Hartford and Hebron. He imitated the style of an English nobleman in his house, kept a coach, and looked with scorn upon Republicans. "In his domestic and private relations he was all that could be desired." The Whigs accused him of communicating with England, and a committee, accompanied by an assemblage of 300 persons, visited him in August 1774, and obtained from him a written declaration that he had not "sent any letter to the bishop of London, or the venerable society for the propagation of the gospel, relative to the Boston port bill, or the tea affair, or the controversy between Great Britain and the colonies, and design not to, during my natural life, as these controversies are out of my business as a clergyman." He gave them also a copy of the "Thirteen Resolves" which he confessed that he had written for the press. He was again visited by the people in September and compelled to sign another declaration. Soon afterward he fled to Boston with the intention of sailing for England to make a representation there of his treatment. It was feared that he would procure a withdrawal of the charter of Connecticut, and his letters were intercepted. One dated 1 Oct. 1774, and addressed to Rev. Samuel Auchmuty, of New York, proposed that Connecticut should be divided between New York and Massachusetts. Dr. Peters obtained

a pension and a grant for his property that was later confiscated by the Americans, but, owing to a quarrel with William Pitt, he lost this about 1803. In 1794 he was chosen bishop of Vermont by a convention of that diocese, but the archbishop of Canterbury refused his consecration on the ground that the number of bishops for America was limited. In 1805 he returned to the United States and traveled to the Falls of Saint Anthony (Minneapolis, Minn.), where he obtained from a Captain Carver a grant of a tract of land 100 miles square. He spent several years in Washington petitioning Congress for a confirmation of this grant. In 1818 he settled in New York City, where he lived in obscurity and on charity. He wrote a 'General History of Connecticut, by a Gentleman of the Province' (London 1781; 3d ed., New Haven 1829). This contains numerous anecdotes and is a satire on the colony, written during Peters' stay in England during the Revolution. In this book he includes the story of the "Blue Laws" of the New Haven colony, which until recently were branded as pure fabrications. It is now known that of the 45 laws included only two or three are pure inventions, the others having existed in one form or other in the colonies although the most extreme were never enforced. Consult Prince, 'Examination of Peters' Blue Laws' (in 'Report of the American Historical Association' 1898), and Trumbull, 'The Rev. Samuel Peters: His Defenders and Apologists' (Hartford 1877).

PETERS, William John, American explorer: b. Oakland, Cal., 5 Feb. 1863. He was educated at Oakland High School and from 1885 to 1897 was engaged in various surveys for the United States government. In 1898-1902 Mr. Peters had charge of the Alaskan explorations made by the United States Geological Survey, accounts of which appear in the publications of that bureau. He was appointed official representative of the National Geographic Society on the Ziegler Polar expedition to Franz Joseph Land in 1903-05 and in 1907-13 was in command of the magnetic survey ships *Galilee* and *Carnegie*. His published works deal with the results of his exploration work.

PETER'S PENCE (Romescot, Rom-gesceot, Rom-feoh, Denarius S. Petri, The King's Alms, Hearth-money). Anciently, an annual tribute of one penny for every household, collected in England and other countries of Christendom, and paid to the Holy See; in modern times, a yearly voluntary contribution made by Catholics, through their bishops, for the maintenance of the Sovereign Pontiff. Several theories are advanced as to its origin. It appears, however, to be beyond reasonable doubt that the tax was inaugurated by Ina, King of Wessex, about the year 727. Writes Roger of Wendover (1237): "In the year of grace 727, the fortunate and powerful King Ina left his kingdom to his kinsman, Athelhard, and went to Rome that he might exchange a temporal for an eternal kingdom. On his arrival, with the consent and approbation of Pope Gregory, he built a house in the city which he called the English School to the end that when the kings of England, and the royal family and the bishops,

presbyters, and clergy came hither to be instructed in the Catholic faith and doctrine, nothing heterodox or contrary to Catholic doctrine might be taught in the English church, and that they might return home confirmed in the faith. . . . He built moreover, nigh to the aforesaid house, a church in honor of the Blessed Virgin Mary, wherein the divine mysteries might be celebrated for the English who came to Rome, and in which they might be buried if any of them chanced to die in Rome. And to give strength and perpetuity to all this, it was ordered by a general decree, throughout the entire kingdom of the West Saxons, in which the aforesaid Ina reigned, that, every year, one penny, which in English is called Romescot, should be sent by every family for the blessed Peter and the Roman Church, that the English who sojourned there might be furnished with the necessary subsistence." ('Flowers of Hist.,' tr. Giles, 1849, Vol. 1, p. 137. Comp. 'Cronica Ranulphi Cestrensis Monachi, lib. v., c. 24, Caxton, 1482). Offa, king of Mercia, according to the same chronicler, augmented this revenue (793) by granting "the blessed Peter's penny . . . which the English call Romescot," to be paid, each year, throughout the 23 shires subject to him, by each family that had possessions in lands yielding rental annually to the value of 30 pence (ib. pp. 163, 164). In the 9th century, Ethelwulf "offered to God and to Saint Peter an annual tax of a silver penny to be paid by each house in England; this tax is now known under the name of Peter's Pence." (William of Malmesbury, *Gesta Regum*, ii, 2). At the request of Alfred the Great, son of the former, the Pope freed the English school from all tribute and tax, and the Romescot was contributed by both the king and the people for a new and twofold object, part for the Pope's personal use, and part to keep up the light in the churches of Saint Peter and Saint Paul. ('*Monumenta Historiæ Britannicæ*' ed. Petrie and Sharpe, p. 472. Comp. ib., p. 552, p. 577, C.). In 1027 King Knut wrote from Rome to the English clergy and laity, and in his letter mentioned "the pennies which we owe at Saint Peter's, Rome," as among the things "we owe to God, according to ancient law." (*Monumenta Historiæ Britannicæ*, p. 597). Considerable irregularity arose, from time to time, in the levying of the Peter's Pence. At times, it was interrupted through misunderstandings and quarrels with the Holy See; sometimes, portions of it were withheld or the sum total forwarded only after several years. No regular payments were made after 1343. King John, in 1199, when he swore fealty to the Pope, expressly promised that in addition to the payment of the sum of 1,000 marks a year the payment of the Peter's Pence should be continued. Edward II in 1307 undertook to collect the arrerages and pay them in instalments. Some English monarchs, however, notably Edward III, in his address to Parliament, 21 Jan. 1365, objected to the collection of the Romescot. Finally in 1366 it was abolished by law. (Lingard, 'History of England,' Vol. III, p. 41, note). Suppressed by statute 25th Henry VIII, ch. 21, in 1534, it was revived by Mary, and finally abolished in England under Elizabeth.

The Peter's Pence tribute is said to have

been introduced into Denmark and Norway by Knut, into Sweden by Olaf, into France by Charlemagne, and into Poland under Casimir I. It was extended to Ireland in 1154, through the much-discussed bull of Adrian IV. It was paid in Scotland, Bohemia and Spain. That toward the end of the 11th century the payment of this tribute implied, in Continental countries, the acknowledgment by the various sovereigns of a kind of suzerainty or temporal protectorate on the part of the Apostolic See, is certain. (Fabre, 'Étude sur le Liber Censuum de l'Eglise Romaine'). And there can be little doubt that after the original object of the Romescot—the support of the English School—had no longer to be met, the same condition obtained also in England. (Livington, 'Rome and England,' p. 47). When Henry VIII broke with the Holy See, and the Peter's Pence was prohibited by act of Parliament, this latter took place "on the grounds," writes Gairdner, "that the realm was not subject to any power outside of it." ('History of the English Church,' p. 145).

The Peter's Pence tribute was collected in midsummer on the days which intervene between the feast of Saints Peter and Paul and the feast of Saint Peter's Chains. The value of the penny varied considerably. In the time of Henry II it amounted to one dollar or a little more of our money. (Malone, 'Church History of Ireland,' 1880, p. 26, note). The annual sum forwarded in the time of King John was £199 8s., according to Lingard, who took the figures, with the amount for each of the 15 dioceses which paid it, from the 'Authentic Register of Innocent III,' in the Vatican Library. ('History of England,' Vol. III, p. 41, note). Some of the coins are still in existence. The English penny was of fine silver, 240 to the pound weight. In the latter days of the tax, the tokens appear to have been manufactured in every cathedral town. On the one side they have the inscription *Sci. Petri M. (Sancti Petri Moneta)*; on the other the name of the place of minting. The Poles, who kept up the impost for about three centuries, paying within that period not far from half a million florins, used a coin for the purpose which was a base mixture of copper and silver. On one side was stamped the image of the Polish eagle; on the other, that of Saint Peter with a key.

The modern Peter's Pence is used by the Pope for the current expenses of his administration. A voluntary offering, inaugurated through the efforts of M. de Coux and Louis Veuillot, editors-in-chief of the *L'Univers*, in September, 1847, its purpose was to relieve a condition of embarrassment then prevailing in the papal finances, as well as, in a practical way, to demonstrate the devotion of Catholics to the Holy Father. One hundred francs for the Pope, deposited at the office of the paper by an anonymous benefactor, was made the occasion of a movement which almost immediately received the indorsement of Cardinal de Bonald, many bishops and the whole Catholic press. In a short time the subscription became general throughout France. (Veuillot, Eugene, 'Louis Veuillot,' Paris, 1901, t. II, pp. 195-198). From France it spread into other countries, especially on the seizure of the papal provinces, at which time the contributions

reached the sum of \$4,000,000 in the year—the highest figure on record; it is now observed by Catholics everywhere. In 1868 the second plenary council of Baltimore decreed that collections for the Pope be taken up annually in all churches of the United States on the Sunday within the octave of Saints Peter and Paul, or at any other opportune time, that the total sum collected be sent, either directly by the bishops themselves or through the metropolitan of each province, to the Sovereign Pontiff. (Cl. P. B. II, n. 48). The pastoral letter of the archbishops and bishops of the third plenary council in 1884 praises the liberality of the people in the collection for the Holy Father "which will continue to be made annually throughout all the dioceses of the country." (Cl. P. B. III, p. 77).

PETERSBURG, Alaska, town on the island of Mitkof. Fishing and lumbering are the chief industries. The town has been incorporated and numbers 1,000 souls.

PETERSBURG, Ill., city and county-seat of Menard County, on the Sangamon River, and on the Chicago and Alton and the Chicago, Peoria and Saint Louis railroads, 20 miles northwest of Springfield. It contains a public library, high school, a monument to Stephenson, founder of the G. A. R., flour mills, canning establishments, brick yards, etc. The water-supply system is municipally owned. Pop. 2,587.

PETERSBURG, Ind., town and county-seat of Pike County, on the Chicago and Eastern Illinois Railroad, 40 miles northeast of Evansville. Here are located Old Indian Fort and the Thornton Home for Orphan Children. There are coal mines, gas and oil wells nearby and there is a large trade in these commodities. The town has flour mills, brick and tile yards, lumber yards, etc. Agriculture and stock raising give employment to great numbers. The town owns the water-supply system. Pop. 2,367.

PETERSBURG, Va., city, port of entry, in Dinwiddie County, on the south bank of the Appomattox River, the upper Appomattox Canal, and on the Atlantic Coast Line, the Seaboard Air Line, and the Norfolk and Western railroads, 22 miles south of Richmond. It is located in an agricultural region in which tobacco is the chief product, and at the northern end of the great peanut belt, and is the controlling peanut market of the country.

Where Petersburg now stands was once the site of an Indian village, which was destroyed by Nathaniel Bacon in 1676. Petersburg was founded by Peter Jones in 1733, incorporated as a town in 1784, and in 1850 was chartered as a city. It was the scene of several engagements during the Revolutionary War, and twice it was occupied by British troops under General Philips. In the War of 1812, and in the war with Mexico, Petersburg sent her full quota to the front. During the Civil War, it was the scene of many of the engagements of the famous Virginia Campaign. East of the city, on Griffith's farm, is a small museum, containing many relics of the war, principally from the old crater which is on this farm. See **PETERSBURG, MILITARY OPERATIONS AGAINST.**

Petersburg, although an important manufacturing centre, is a residential city of peculiar charm, with many stately mansions in spacious grounds. It has two well-kept parks; supports three prosperous banks; and has 10 miles of street railway. In 1916 the real estate of the city was valued at \$11,428,865, and the personal property at \$8,820,465. The prominent public structures are the Y. M. C. A. building, Masonic Temple, Odd Fellows' and Red Men's buildings and the municipal buildings. It is the site of the State Central Hospital for the Colored Insane, with 1,000 patients, a Home for the Sick and the Benevolent Mechanics' Association. The educational institutions are the Virginia Normal and Collegiate Institute, for colored students; the Petersburg Academy for young men, the Southern Female College; Saint Joseph's School; 11 private academic schools of high grade; public and parish schools and the library and museum of the Mechanics' association.

Owing in part to its excellent water power, besides its unusual transportation facilities, and the abundance of raw materials, Petersburg's manufacturing interests are many and various. In 1916 the city had 290 factory establishments, employing over 6,000 hands, who received \$1,750,000 in the year's wages. The output was valued at \$11,000,000. The five cotton mills consume annually 10,000 bales of cotton and produce 11,000,000 yards of cloth and upward of 100,000 pounds of thread and yarn; much of which is exported direct to China and Central America. One of the flour mills has a yearly output of 40,000 barrels, and the four corn mills grind a million bushels of corn annually. The yearly lumber export is 50,000,000 feet, cut in the surrounding forests. The trunk factories turn out daily 1,200 trunks and 1,500 handbags. The tanbark mills grind between 5,000 and 6,000 tons of bark, and 3,000 tons of sumac leaves. Other industries include the making of fruit baskets and crates in enormous quantities, veneer and wheels; shipyards, which build not only the hulls, but the engines also; foundries and machine shops; a silk factory; brick works, etc. The government is administered under a charter of 1875 which provides for a mayor, who holds office four years, and a council. The voting population numbered, in 1916, 3,582 whites and 2,187 colored. The annual water commerce of the port aggregates 200,000 tons. The city owns and operates the waterworks. Pop. 31,002.

PETERSBURG, Military Operations Against. When General McClellan, in the

summer of 1862, was forced to abandon his advance upon Richmond by way of the Peninsula and fall back to Harrison's Landing, he proposed to cross to the south side of James River and operate against Richmond by that side, seizing Petersburg and the railroads leading to that city and Richmond from the south, and for this purpose asked that his army be largely reinforced. General Halleck, commander-in-chief of the army, disapproved the movement and withdrew the Army of the Potomac from the Peninsula. No further effort was made for a serious advance south of the James until early in May 1864, when, in co-operation with the campaign beginning in the Wilderness, General Grant ordered General Butler, commanding the Army of the James, to cross to the south side of the river and, moving close along its bank, press for Richmond. Butler was stopped at Drewry's Bluff (q.v.), and held to his intrenchment at Bermuda Hundred. On 9 June Butler ordered General Gillmore and General Kautz to capture Petersburg and destroy the railroad bridge across the Appomattox. On the morning of the 10th Gillmore, with 1,800 men arrived before the Confederate works on the City Point road, General Hinks, with 1,200 men coming up a mile to his left. Both thought the works too strong to be carried, and withdrew. Kautz, with 1,500 cavalry, planning to strike the city from the south, moved up by a circuit over the Jerusalem plank-road, four or five miles to Gillmore's left and, near noon, made three unsuccessful attacks, then turned the Confederates in his front, and advanced close to the city waterworks, on Reservoir Hill, where he found infantry and artillery intrenched, and, believing that he could not capture the city, withdrew, followed by Dearing's Confederate cavalry brigade. At this time Petersburg was held by about 2,400 infantry under General Wise, Dearing's cavalry, and some local militia.

After the loss of 53,400 men in his campaign from the Wilderness to Cold Harbor, in an effort to reach Richmond from the north, General Grant concluded to transfer his army to the south of James River and conduct operations against Petersburg and Richmond similar to those proposed by McClellan two years before. General Halleck objected, advocating an investment of Richmond from the north, but Grant adhered to his own plan, sent Sheridan to destroy the railroad north and west (see TREVLIAN RAID AND BATTLE OF TREVLIAN STATION), and began preparations to withdraw from before Lee at Cold Harbor and cross to the south of the James. The general movement began on the 12th and was skilfully conducted; and crossing the Chickahominy and then the James, at and near Wilcox's Landing, the entire Army of the Potomac was south of the river, in rear of Bermuda Hundred, at midnight of the 16th.

First Assault.—Before all the Army of the Potomac had crossed the James, Grant ordered an advance on Petersburg for 15 June. The Petersburg intrenchments ran from the Appomattox River east a mile to the City Point Railroad; then south three miles to Norfolk Railroad; then west four miles to a point a mile west of the Weldon Railroad; then north two miles to the Appomattox. The length of

the intrenchments from the Norfolk Railroad west to the Jerusalem plank-road was one and one-half miles. These works 15 June were held by General Wise's infantry brigade of 2,400 men, General Dearing's cavalry brigade of 3,500, and a small body of local militia. Gen. W. F. Smith, who had rejoined the Army of the James at Bermuda Hundred on the night of the 14th and next morning with his infantry division increased to 13,700 officers and men, and Kautz's division of 2,400 cavalry, marched along the City Point Railroad and wagon-road, General Hinks' negro brigade capturing two guns and a line of rifle pits. When he came under fire of artillery, he reconnoitered and formed his troops for assault. Ignorant of the comparatively slender force behind the works, his reconnoissance was deliberate and prolonged, and it was 5 p. m. when he concluded not to assault in column under a heavy artillery fire that had been opened upon him, but to use his own artillery against one of the Confederate redoubts and to attack the Confederate works with a strong skirmish-line. When he was ready for the movement it was found that all the artillery had gone to the rear to water the horses, and there was a delay of an hour or more. About seven o'clock the guns opened, the skirmishers advanced, by nine o'clock one and one-half miles of the Confederate intrenchments had been taken, and with them 16 guns and nearly 400 prisoners. These captures laid the city open to an unobstructed advance, as no other works then existed and no reinforcements had yet been sent. General Hancock, commanding the Second corps, had been ordered to march on Petersburg on the morning of the 15th after rationing his men; but neither he nor General Meade was informed of Smith's movement; there was delay in furnishing the rations; he started late in the morning without them; the position he was to occupy was incorrectly laid down on the maps, and it was not until 5 p. m. that he was notified to hasten to Smith's assistance. In fact this was the first inkling that Hancock had that there was any intention to attack Petersburg on that day. It was night, though bright moonlight, when he came to Smith's position, and, at Smith's request, relieved his troops. Had there been a proper understanding that day between Meade, Hancock and Smith, Petersburg would have been taken before night, and a weary, wasting 10 months' siege avoided. During the night nearly the whole of Lee's army was poured in from every quarter between Petersburg and the sleeping Federals. Hoke's division was sent by Beauregard to form on Wise's left and extend to the Appomattox. B. R. Johnson's division was withdrawn from the Bermuda Hundred line and early on the 16th took position on Hoke's right. Wise's right was still half a mile from the Jerusalem plank-road. From Wise's right to Hoke's left, a distance of five miles, the Confederates had, on the 16th, besides artillery, about 14,000 men. When daylight came the attacking force found a 'new line of earthworks before the city, manned by the best of Lee's veterans. On the morning of that day Egan's brigade of Hancock's corps attacked and carried a Confederate redoubt. Burnside's Ninth corps came up at 10 A. M. and formed on Hancock's left. The

Union troops now fronting Beauregard's 14,000 numbered 53,000 men. At 6 p.m. Hancock assaulted with the Second corps, supported by two brigades of the Eighteenth on the right and two of the Ninth on the left. Three redoubts and their connecting works were carried. The Union loss was severe. B. R. Johnson's withdrawal from the front of Butler's right had been discovered during the night of the 15th, and early next morning General Terry advanced, captured some pickets and, after sharp resistance, occupied the main line of Beauregard's intrenchments, taking many prisoners. Meade had been ordered to attack with artillery at 6 p.m. At the same hour Pickett's division, sent by General Lee from Drewry's Bluff, drove in Terry's skirmishers, and Terry abandoned the captured works, which were reoccupied by Pickett, who, advancing from them, attacked Terry and was repulsed. On the 16th General Ledlie, sent to relieve Potter's troops, advanced to within one and one-half miles of the city into which he threw shells. On the morning of the 17th the Second and Ninth corps under General Potter again assaulted the Confederate works, carrying portions of them and taking four guns and 400 prisoners. Meanwhile Warren's Fifth corps had come up and formed on the left of the Ninth. Another assault was made in the afternoon by the Second, Ninth and Fifth corps, and continued until after dark, with heavy losses on both sides, but the advantage remained with the Union troops, who had gained several important positions. During the night Beauregard withdrew across a ravine, formed a new line from 500 to 1,000 yards in rear of the one he had been occupying, and immediately intrenched it. General Meade ordered a general assault for the 18th, which was made by piecemeal and repulsed, but the ground gained, close up to the Confederate works, was intrenched, and on this part of the field the two opposing lines remained substantially the same in position to the close of the war. In these attempts to carry Petersburg by assault 10,000 men had been lost; it was now known that Lee's entire army was being thrown into the place; Meade said there was "nothing further to be gained by direct attacks"; and Grant ordered that no more assaults be made and determined to invest the place partially by extending his left across the Weldon Railroad and to the South Side Railroad.

Petersburg.—General Grant having decided that a siege was necessary to reduce Petersburg, ordered strong works to be thrown up close to those of the Confederates; close connection was made with the Army of the James on the right; and the first offensive movements were to destroy communication with Petersburg on the south. On 22 June General Wilson, with 5,500 cavalry and 16 guns, marched to destroy the Petersburg and Weldon Railroad and the South Side Railroad (see WELDON AND SOUTH SIDE RAILROAD, WILSON'S RAID ON), and on the same day the Second and Sixth corps made an effort to seize the Weldon Railroad near Globe Tavern, but were severely checked by A. P. Hill's Confederate corps when about a mile from the road. (See JERUSALEM PLANK-ROAD, ENGAGEMENT NEAR). Being reinforced by Meade at sundown, both corps advanced, retaking the lost ground. Hill

was obliged to withdraw with his 2,500 prisoners, and the cutting of the Weldon Railroad was accomplished. Meanwhile, Kautz and Wilson, with 8,000 cavalry, cut the railways south of Petersburg over an area of 22 miles, and then pushed on, against strong opposition to Burke's Station at the junction of the Southside and Danville railroads. Both of these roads were thoroughly torn up; and then these commanders attempted a circuit to strike the Weldon Railroad. They were met by Hampton's cavalry and supporting infantry, and repulsed with heavy losses; and were compelled to retreat to the position before Petersburg. Both armies remained comparatively quiet for more than a month, intrenching and throwing up redoubts, but there was incessant skirmishing all along the lines, with severe losses. On 25 July Grant ordered a movement north of the James to threaten Richmond and thus draw from Petersburg a part of Lee's army to give more likelihood of success in a proposed explosion of a mine in front of his army on the Petersburg line and a subsequent assault. This movement resulted in the battle of Deep Bottom (q.v.), and the transfer by Lee of five infantry and two cavalry divisions to the north side of the James, thus reducing the force south of it to three divisions of infantry and one of cavalry.

Petersburg Mine.—In the latter part of June Lieutenant-Colonel Pleasants, 48th Pennsylvania, suggested to General Potter, his division commander, the mining of a Confederate redan in his front, and agreed to conduct the operation. General Burnside authorized it to be done, and General Meade, though not having much faith in it, assented. The redan was held by Elliott's brigade of B. R. Johnson's division, and was opposite the centre of the Ninth corps, where the opposing lines were not more than 120 yards apart. Pleasants had many difficulties to overcome, but the work was finished ready for charging by 23 July. The main gallery was 511 feet long, with two lateral galleries of 37 and 38 feet, in which were eight magazines, each charged with 1,000 pounds of powder. It was intended that, upon the explosion of the mine, the artillery on the right and left should open a furious fire, and that two brigades of General Ferrero's colored division should lead in the assault upon the wrecked work; but as these troops had never been under close fire of the enemy, Generals Meade and Grant objected, and Burnside substituted General Ledlie's division. The whole army was held in readiness to advance and take any advantage gained by the confusion anticipated in the Confederate lines. The order for the attack was issued by General Meade on the 29th, and was full and precise as to what was to be done by each commander. Burnside was to spring the mine at 3.30 in the morning of the 30th; his guns were to begin at once a bombardment of the whole line, and of Cemetery Hill, 400 yards in the rear of the mined works; his assaulting columns were to rush forward, seize a crest of ground 150 yards beyond the breach in the line caused by the explosion, reform and push on, closely followed by General Ord's corps on the right and by General Warren's on the left. The fuses failed, however, and had to be relighted after half an hour's delay and it

was 4.40 when the explosion occurred, carrying men, guns, carriages, dirt and timbers high into the air and leaving a crater 170 feet long, 60 feet wide and 25 to 30 deep. Burnside had failed to carry out the precise orders given him, the guns did their part accurately and with effect, but there was delay and confusion in getting the charging columns over his own works. Ledlie's division, without its commander, moved into the crater and halted, filling it with a confused mass. A corps of negro troops had been selected for this movement but General Grant objected and Ledlie's force was substituted. Anticipating a storm of artillery fire from the works beyond, it did not go forward; was not promptly supported; other troops rushed into the crater and added to the confusion. The Confederates were silent for a full half hour, and then, recovering from their first surprise, reoccupied the intrenchments they had abandoned on the right and left; swept the crater with canister; and shortly after noon the Union troops were ordered to fall back either during the day or under cover of night. Those in the crater were driven out or captured early in the afternoon, losing many in killed and wounded, though they had not much more than 100 yards to go to reach the intrenchments from which they had charged. General Grant says: "The effort was a stupendous failure . . . due to inefficiency on the part of the corps commander and the incompetency of the division commander who was sent to lead the assault." The Union loss was 504 killed, 1,881 wounded and 1,413 captured or missing; an aggregate of 3,798, of whom 3,475 were of the Ninth corps. The Confederate loss was not over one-third of that sustained by the Union troops.

Siege of Petersburg and Richmond.—On 30 July 1864 the armies of the Potomac and the James, investing Petersburg and Richmond, numbered about 59,000 effective infantry and 12,000 cavalry. General Lee had about 38,000 effective infantry and 8,300 cavalry. The Army of the Potomac undertook the investment of Petersburg, while the Army of the James held Bermuda Hundred and all the ground possessed north of James River. The Ninth corps was on the right of the Army of the Potomac at Petersburg, the Fifth in the centre, and the Second on the left. The Sixth corps had been sent to Washington to oppose General Early. To prevent General Lee from sending reinforcements to Early, Grant 12 August, ordered another movement north of the James to threaten Richmond, which resulted in the second battle of Deep Bottom (q.v.), in which the Union loss was over 2,700 men. Under cover of this movement Warren's Fifth corps, with a brigade of cavalry, moved to the left on the morning of the 18th and, after some hard fighting for four days, with heavy losses on both sides, succeeded in gaining and holding the Weldon Railroad at Globe Tavern, about four miles south of Petersburg. Thus clinching for Lee the loss of one of his most important lines of communication. (See **GLOBE TAVERN, BATTLE OF**). On the 22d General Hancock, with about 8,500 infantry and cavalry, moved to destroy the railroad south of Globe Tavern. By the 25th he had destroyed it as far down as Ream's Station and three miles beyond, 12 miles south of Petersburg when he was at-

tacked by A. P. Hill and driven back with a loss of 2,700 men, 12 colors and 5 guns. Hill's losses were equally severe and he withdrew, having accomplished nothing, as Warren still held the railroad. (See **REAM'S STATION, BATTLE OF**). For a full month quiet continued along the lines. On 28 September, to retain Lee in his position, Grant having heard that only a few men were left to hold the Confederate lines north of the James, ordered Butler, who was at Bermuda Hundred, to send the Tenth (Birney) and the Eighteenth (Ord) corps, with Kautz's cavalry across the river and attempt to gain Richmond by a sudden attack before troops could be brought in to prevent it. The crossing was made at night on pontoon bridges muffled with straw. Birney crossed at Deep Bottom, and Ord at Aiken's Landing, eight miles above. Birney attacked the works on Spring Hill with colored troops. They took the position in a fierce engagement, losing one-third of their number. Ord's division attacked Battery Harrison, the strongest defensive works around Richmond. It was carried, though with desperate losses. (See **FORT HARRISON, BATTLE OF**). Further advance was prevented by the most obstinate resistance, and the Confederates made repeated efforts to regain the lost positions, but without success. Kautz's cavalry meanwhile had succeeded in reaching a point within three or four miles of Richmond, at the inner lines of defense, but was attacked and driven back. The affair was redeemed by the Tenth corps, and the Confederates retreated to Richmond after losing heavily. The two opposing lines north of the James maintained their relative positions to the close of the siege. In co-operation with this movement north of the James, Generals Warren and Parke, with two divisions each of the Fifth and Ninth corps and Gregg's cavalry division, moved 30 September to extend the intrenched line beyond the Weldon Railroad in the direction of the South Side Railroad. There was sharp fighting on 1 and 2 October, but the movement was checked after reaching the Weldon Railroad south of Globe Tavern, the Union loss being about 2,800, the Confederate loss about 1,000 (See **POPLAR SPRING CHURCH, BATTLE OF**). On 7 October Kautz's cavalry division of 1,700 men, holding the right of the Union line north of the James, was attacked by the Confederate infantry divisions of Field and Hoke and Gary's cavalry brigade, and driven back under cover of the infantry, losing 274 men and eight guns. Field's division followed in an attempt to turn the right of the line attacking the Tenth corps on the New Market road, and was repulsed with the loss of three brigade commanders and 700 men. On the 13th General Butler made a reconnaissance of the Confederate works on the Darbytown road, north of the James; one brigade made an assault upon them and was repulsed. On 27 October parts of the Ninth, Fifth and Second corps, together with Gregg's cavalry division, in all about 38,000 men, moved to the left to seize the bridge over Hatcher's Run and capture the Confederate works, which at that point Grant thought were not strongly held, the chief objective being the seizure of the South Side Railroad. The movement failed, and the troops were withdrawn with a loss of over 1,700, the Confederate loss being about the same. (See **HATCHER'S RUN (BOYDTON ROAD)**),

BATTLE OF). On the 27th and 28th General Butler made another movement on Richmond north of the James, by the Williamsburg, Charles City, and Darby roads. A severe engagement took place on the old battlefield of Fair Oaks or Seven Pines, in which Butler's forces were repulsed by Longstreet, and fell back to their camps near Fort Harrison, with a loss of about 1,100 men. On 6 December General Warren, with his own corps (Fifth), Mott's division of the Second, and Gregg's cavalry, started on a raid against the Weldon Railroad, which was destroyed as far as Hicksford, on the Meherrin River, about 40 miles south of Petersburg. A. P. Hill was sent to intercept him, but failed to do so; and having completed his work, Warren returned to his camps.

Winter had now set in, and was of unusual severity, entailing much suffering upon both armies, but especially upon the Confederates, who were poorly fed and clothed. Lee strengthened his works and extended them up the south side of Hatcher's Run and where the Boydton plank-road crosses the run. A. P. Hill held the right from Hatcher's Run to Fort Gregg; Gordon and R. H. Anderson held from Hill's left to the Appomattox, and Longstreet from the Appomattox to the Confederate left, north of the James, at White Oak swamp. The length of the line was about 37 miles, eight of which were north of the James. To cover those 37 miles Lee had, 30 December, about 59,000 officers and men. At the same date Grant had about 110,000 men. With these he held Lee tightly to his works while armies elsewhere were carrying out his own comprehensive plans. On 5 February 1865 Grant put the greater part of his army in motion to the left to destroy Lee's communications, resulting in the battle of Hatcher's Run, Dabney's Mill, and Armstrong's Mill, and the extension of his intrenched line to the Run. The loss was about 1,000 to the Confederates and nearly 2,000 to the Union forces. The ford at Hatcher's Run was now securely in the hands of the Nationals and the City Point Railroad was promptly extended to that position.

General Lee had foreseen that the evacuation of Petersburg and Richmond would be forced upon him when Sherman approached from the south, and it was determined early in March that, as soon as the roads would admit of movement, the two places should be abandoned and his army moved to Danville to unite with Gen. J. E. Johnston and attack Sherman, and preparations were made accordingly. Meanwhile Lee proposed to make a sortie in order to gain some of the works on the right of the line held by the Army of the Potomac, near the Appomattox, and the ridge in their rear, with the expectation that this would oblige Grant to concentrate there by drawing in his left, and thus postpone the necessity for abandoning Richmond and Petersburg until the weather was favorable for falling back to Danville. To this President Davis gave his assent. General Gordon with about one-half of the army, was given charge of the movement, which was directed against Fort Stedman, on the Ninth corps line, where the opposing lines were only 150 yards apart, the pickets 50 yards apart. The chance was a hazardous one, but if successful

the movement would have cut the National army in two and opened a gap for the escape of Lee's army. The assault was made at half-past four in the morning of 25 March, and was at first successful, the Confederates carrying the fort and works on either side of it; but after a hard fight of four hours they were driven back, with an estimated loss of 4,000 men and many colors. The Union loss was about 2,200. (See FORT STEDMAN, ASSAULT ON). Before this assault Grant had ordered a movement for the 29th to destroy the railroads leading into Petersburg from the south, force Lee to come out of his intrenchments and fight on open ground, or so far attenuate his line as to give chance for a successful assault. He had been joined by Sheridan and his cavalry from the Shenandoah Valley, and had under his command 101,000 infantry, 14,700 cavalry, and 9,000 field artillery, with 369 guns, an aggregate of 124,700 men. The Confederate army under General Lee numbered about 46,000 infantry, 6,000 cavalry and 5,000 field artillery, with about 190 guns, an aggregate of 57,000 men, or less than half of Grant's force.

The movement, which was the beginning of the end, began on the day fixed by Grant. Its object was to turn Lee's right with an overwhelming force. The greater part of the Army of the James was marched secretly on the night of the 27th from the right to the left of the Army of the Potomac, 36 miles, and on the morning of the 29th Sheridan's cavalry, with the Fifth and Second corps, moved to the left attacking the intrenchments at the junction of several roads from the north and south with the White Oak Road. The result was the battles of Dinwiddie Court-House and White Oak Road, on the 30th and 31st, followed by the decisive battle of Five Forks (q.v.) on 1 April.

Final Assault Upon Petersburg.—General Grant heard of the victory of Five Forks at 9 o'clock that night and ordered General Humphreys, commanding the Second corps, on the left of the general intrenched line, to "feel for a vulnerable point in the enemy's intrenchments, and, if one was found, to assault immediately." Humphreys assaulted before midnight, carried the picket-line, but was repulsed when he approached the main line. A general bombardment of the Confederate lines was kept up throughout the night and, under Grant's orders, at 4 A.M. of 2 April Ord's, Wright's and Parke's corps, about 63,000 men, assaulted the lines before which they had been held for 10 months, and which were now defended by less than 20,000 men. On many parts of the line there was desperate resistance, but the exterior lines were finally captured, Humphreys following up their successes by a new attack on his front, taking the redoubt which foiled him in the night attack. Lee thereupon sent word to President Davis that his lines were broken in three places, and that Richmond must be evacuated, and that he would hold on to his interior line until night, and then endeavor to reach Danville. At 3 P.M. Lee ordered a retreat, which began at 8 o'clock, the point of assemblage of his various columns being Amelia Court-House. Grant ordered a general assault for the morning of the 3d, but at 3 A.M. it was discovered that Lee had abandoned all his works. Petersburg was taken possession of by

Willcox's division of the Ninth corps, and at 8.15 A.M. Richmond was formally surrendered to General Weitzel, who had entered it from north of the James.

The Union loss in the final assault on Petersburg, 2 April, was 625 killed, 3,189 wounded and 326 missing. There is no record of Confederate losses. From 15 June 1864 to 9 April 1865 the campaign for Petersburg and Richmond cost the Union armies under General Grant 6,883 killed, 35,414 wounded and 20,859 captured or missing; an aggregate of 63,156 officers and men. The Confederate loss for the same period is not known.

PETERSEN, pā'tēr-sēn, **Niels Matthias**, Danish historian and philologist: b. Sanderup, island of Fünen, Denmark, 24 Oct. 1791; d. Copenhagen, Denmark, 11 May 1862. He studied philology and history, and in 1845 was appointed to the chair of Norse languages in the University of Copenhagen. He was an authority on mythology, geography and history, his specialty being the history of literature, and though some of his works have been superseded his 'History of Danish Literature' (1853-64) is still a standard. Among his books are 'Det Danske, Norske og Svenske Sprogs Historie' (1829); 'Oldnordiske Sægaer' (12 vols., 1826-36); 'Danmarks Historie i Hedenold' (1834); 'Den Nordiske Mythologi' (1849); 'Bemærkninger om Modersmaalet' (1853); 'Bidrag til den Danske Litteraturs Historie' (5 vols., 1853-61); 'Bidrag til den old Nordiske Litteraturs Historie' (1866), etc., all published in Copenhagen.

PETERSON, **Frederick**, American neurologist: b. Faribault, Minn., 1 March 1859. He was graduated from the medical department of the University of Buffalo, studied abroad and in 1882-83 was professor of general pathology and laboratory director in the University of Buffalo. In the latter year he removed to New York, where he practised as a nerve and brain specialist, and in 1893-94 was professor of neurology at the University of Vermont. He has been attending physician at various hospitals, was professor of neurology at the Woman's Medical College of the New York Infirmary, pathologist in the New York City Insane Asylum, president of the board of managers for the Craig Colony of Epileptics, chief of the clinic in the department of nervous diseases at Columbia, and in 1900 was made president of the New York State Commission in Lunacy. He was professor of psychiatry in Columbia University 1903-14. He has for several years been associate editor of the *New York Medical*

Journal and the *Journal of Nervous and Mental Disease*. His publications include 'Poems and Swedish Translations' (1883); 'In the Shade of Ygdrasil' (1893); 'Nervous and Mental Diseases' (1901-11); 'American Textbook of Legal Medicine and Toxicology' (1903); 'A Song of the Latter Day' (1904).

PETERSEN, (Hjalmar) Eilif, Norwegian painter: b. Christiania, 1852. He was educated at Carlsruhe and under Lindenschmit at Munich. His early efforts were confined to historical episodes of which his 'Christian II, signing a Death Warrant' (1876) is a good example. It is now in the Museum of Breslau. He next turned to religious subjects, of which 'The Ascension,' at Ulleven, is perhaps his greatest work. His next field was landscape and genre painting in which he was also successful. His best works in this style are 'Piazza Montanara' (1882); 'The Laundresses' (1889); 'Woodland Lake' (1891); 'Summer Night,' in the Munich Pinakothek and 'Gajamars Song' (1907).

PETERWARDEIN, pā'tēr-vār-din, Jugoslavia, a town in Croatia-Slavonia, on the right bank of the Danube, 45 miles by rail northwest of Belgrade. It is the site of the castle of Peter the Hermit (q.v.). It stands partly on a steep rock and partly on a marshy flat below and is the strongest fortress on the Danube. It communicates by a bridge of boats and a railway bridge with the town of Neusatz on the opposite bank. The fortifications are extensive and contain barracks for a garrison of 10,000 men; but the town itself is small. It has, however, four churches, a military hospital, an arsenal, a high school and a trade in wine and fruit. A great victory was gained here (5 Aug. 1716) over the Turks by Prince Eugene. Peterwardein was occupied by the Hungarians in the civil war of 1848-49. It was surrendered to the Austrians, 6 Sept. 1849. Pop. 6,000.

PETIGRU, pēt'i-groo, **James Louis**, American lawyer: b. Abbeville District, S. C., 10 March 1789; d. Charleston, S. C., 3 March 1863. He was graduated at the South Carolina College, now the University of South Carolina, in 1809 and in 1812 was admitted to the bar. Having attained professional eminence in the rural districts, he removed to Charleston, where he rapidly rose to distinction. In 1822 he became attorney-general of the State, which office he held for eight years. During the Nullification troubles of 1830-32 he opposed the doctrine of the State veto and was the most notable of the leaders of the 'Union and State Rights' party. Upon the defeat of his party, he became in his political capacity an object of much popular dislike, but his talents and virtues nevertheless secured him the respect of the community in which he lived, and he continued to maintain his position as a leader at the bar with scarcely a rival. He subsequently served in the State legislature and despite general condemnation of his political opinions he was entrusted with the codification of the laws and statutes of South Carolina. Although stoutly opposed to the secession movement of 1860-61, he followed the fortunes of his State. Consult Grayson, W. J., 'James Louis Petigru' (New York 1866); and a memorial volume published by the Charleston bar in 1867.

PETIOLE, in botany, the stalk of a leaf. When the petiole is wanting, the leaf is said to be sessile. In general, however, it is distinctly marked and is usually either round, or half-cylindrical and channeled on the upper side. In the poplar it is strongly flattened at right angles to the blade and hence the remarkable movement observable on the least breath of wind, especially in the aspen. Sometimes, as in the garden sweet-pea, the petiole is furnished with a kind of border or wing. In many umbelliferous plants its base is dilated into a broad membranous inflated sheath. In grasses and various other plants it consists of a sheath embracing the stem; in the pea tribe the apex of the petiole is often changed into a tendril. In one section of the genus *Astragalus* (tragacanth) it hardens into a spine after the leaflet drops. The petiole in some Australian species of acacia and eucalyptus is flattened into a leak-like expansion, occupying the place of the true leaf; such petioles have received the name *phyllodia*. See LEAVES.

PÉTION, pā-tē-ōn, **Alexandre Sabes**, Haitian soldier and politician: b. Port-au-Prince, Haiti, 2 April 1770; d. there, 29 March 1818. He was educated in the military school of Paris, entered the French army in Haiti and in 1791 joined the forces of Toussaint l'Ouverture (q.v.), serving as commander of artillery. In 1799 he entered the service of General Rigaud and upon the latter's defeat by l'Ouverture was obliged to leave the island. He went to France and returned in 1802 with the rank of colonel under General Leclerc, who was to subdue the island but in the same year Pétion joined the revolt under Henry Christophe and later served under Dessalines. The latter was murdered in 1806 and Christophe assumed the Presidency in 1807. The south and west provinces, however, declared for Pétion and chose him president of that portion of the island, which resulted in almost continual warfare. Pétion's administration was in marked contrast to that of Christophe. He opened his ports, granted protection to commerce, paid the debts of the country and introduced measures which gave great commercial and agricultural prosperity to the country. In 1815 he was elected President for life with power to nominate his successor, but in the latter part of his administration the financial affairs of the government became depressed, and Pétion fell a victim to hypochondria in which state he starved himself to death. Consult Saint John, Sir S. B., 'Hayti; or, the Black Republic' (London 1889).

PÉTION DE VILLENEUVE, dē vėl-něv, **Jérôme**, French revolutionist: b. Chartres, France, 1753; d. near Saint Emilion, France, 1794. He was an advocate in his native city when chosen a deputy to the States-General in 1789, and in 1790 was president of the National Assembly. He later became a member of the Jacobin Club and a supporter of Robespierre. He was elected mayor of Paris in 1791, and president of the Convention in 1792 and voted for the execution of the king. Although he had exhibited unnecessary cruelty in forcing the return of the royal family from Varennes, he was nevertheless suspected of being a royalist, and the jealousy of Robespierre being aroused he was arrested with the Girondists in 1793. He

escaped, but perished in a field near Saint Emilion, either by suicide or starvation. His works were published in four volumes in 1793. Consult Dauban, C. A., 'Mémoires inédites' (Paris 1866).

PETIT, pè-tê, **Louis**, French clergyman and author: b. Viuz-la-Chiésaz, Haute-Savoie, France, 21 Feb. 1868. He was educated at Notre Dame des Châteaux, Pas-de-Calais, France, the Assumption Scholasticate, Osmia, Spain, and at Rome. He entered the order of the Augustinians of the Assumption in 1880 and was ordained in 1891. He was professor at Notre Dame des Châteaux, and at the Oriental Seminary, Phanaraki, Constantinople, in 1893-94. Thereafter he was superior of the houses of his order at Toulouse in 1894-95, at Kadi-Keui, Constantinople, in 1895-1908, and superior of Assumptionist missionaries in the Orient 1903 and from 1906 to 1912 was member of the general chapter of his order. From 1908 to 1911 he was engaged in research work in the Propaganda and Vatican Archives, Rome. In 1912 Dr. Petit was made archbishop of Athens and apostolic delegate to Greece. He originated the plan of recasting and publishing in separate monographs Le Quien's 'Oriens Christianas'; made two trips of scientific exploration to Mount Athos in 1901 and 1905 and in 1911 was theologian and consultor of the Council of Armenian Catholics, Rome. His published works include 'Les confréries musulmanes' (1899); 'Typicon de Grégoire Pacouranos pour le monastère de Bachkovo' (1904); 'Serborum per Hungarian constitutorum ordinationes ecclesiasticae' (1906); 'Acta dissidii ecclesiastici græco-bulgarici' (1911); 'Recueil des inscriptions chrétiennes de l'Athos' (1904). With Martin he edited and contributed to Mansi, 'Amplissima collectio conciliorum'; and is a frequent contributor to religious reviews and periodicals.

PETIT DE JULLEVILLE, dē zhũl-vêl, **Louis**, French historian of literature: b. Paris, 18 July 1841; d. Paris, 1900. He was graduated from the École Normale in 1863, receiving their degree of doctor of letters in 1868, and after teaching in the Collège Stanislas of Paris and the faculty of letters at Dijon, became professor of French literature in the Paris faculty of letters in 1886. His principal work is 'History of the Theatre in France' (1880-86); very complete with regard to the old French theatre. He gives in 'The Theatre in France' (1889) an account of the evolution of the French drama down to the present time. In 1896 he commenced the publication of a 'History of the French Language and Literature,' but died before its completion.

PETITION, Right of, in public law, the right of the citizen to present a formal supplication to the government for the granting of some favor, usually the redress of a grievance, in which the established courts were not authorized to act. The better opinion is that it also includes the right of the petitioner to have his petition heard, otherwise the right of petition is worthless. Like many of the great constitutional safeguards it is the result of a long struggle against tyranny. It was implied in the guarantees of Magna Charta and was so frequently exercised in the time of Edward II that

it became necessary to formulate rules by which the task of hearing petitions could be facilitated. During this period petitions were usually made to the king, but later when Parliament had succeeded in establishing its supremacy over the royal power petitions came to be preferred to that body instead. The Stuarts looked with disfavor upon the growing practice of presenting petitions, and during the reign of Charles II Parliament passed an act forbidding the presentation of petitions signed by more than 10 persons and placing other restrictions upon the right of petition. The refusal of James II to hear the petition of the seven bishops, who refused to publish his declaration of independence, created a great sensation throughout England, and in the Declaration of Right drawn up by Parliament after the Revolution of 1688 it was declared to be the right of English subjects to petition the king and all commitments and prosecutions for such petitioning were declared to be illegal. This right was confirmed by the Act of Settlement of 1700. Petitions to Parliament now became very numerous and the exercise of the right may be said to have culminated in the Chartist movement of 1848, when a petition bearing its signatures of more than 1,000,000 persons was presented to Parliament praying for annual parliaments, universal suffrage and other reforms. In early times it became the custom of Parliament at the opening session to appoint "receivers" and "criers" of petitions, who examined them and referred them to the courts or to Parliament for consideration. In order to receive attention from Parliament petitions must be in a prescribed form, respectful in language and, with a few specified exceptions, must be presented by a member. The member, however, is not compelled by law to present it to the Parliament, and this omission has occasionally been the cause of complaint.

The first amendment of the Constitution of the United States prohibits Congress from making any law to abridge "the right of the people to peacefully assemble and to petition the government for a redress of grievances." It will be seen from the language of this provision that its purpose is not to create the right of petition, its existence being assumed, but to secure it. In spite of this provision the National House of Representatives in the course of the controversy over slavery encroached seriously upon this right. Beginning as early as 1790 petitions for the abolition of the slave trade and the prohibition of slavery in the District of Columbia were presented to Congress. The latter were referred to the Committee on the District of Columbia and reported unfavorably. As the petitions increased the committee ceased to make reports. In 1836 the House adopted a rule providing that all petitions relating to slavery should be laid on the table without action and without being printed or referred to a committee. This was the first of the so-called "gag" rules and was stoutly opposed by John Quincy Adams, who had presented most of the petitions relating to slavery. Finally in January 1840 the House adopted a rule declaring that no petition praying for the abolition of slavery or of the interstate slave trade should be received or entertained in any manner whatever. For the repeal of this illiberal rule Adams labored incessantly until his

efforts were crowned with success in 1844. After this the right of petition was never again abridged by Congress.

By the present rule petitions are delivered to the clerk, endorsed with the name of the member presenting them and of the committee to which they are referred, and by him they are transferred to the appropriate committee. All of the States with one or two exceptions have constitutional provisions guaranteeing the right of petition.

JAMES WILFORD GARNER,
Professor of Political Science, University of Illinois.

PETITION OF RIGHT, in English politics, a celebrated statute of Parliament passed in 1628 declaratory of certain of the ancient rights and privileges of Englishmen. It had its origin in the controversy between Charles I and the Parliament concerning the prerogatives of the king and the privileges of the Commons. Charles had violated the privileges of Commons and the rights of the people by evasions of the Constitution. Accordingly it was resolved to demand from him a formal concession of those rights and privileges, in particular, which he had violated and to refuse a grant of supplies until his consent had been given. These rights were embodied in a statute, but the document is popularly known as the Petition of Right from the fact that the grievances of the Commons were presented in the form of a petition. When the petition was presented to the king for his approval he quibbled and hesitated and finally answered in a general way "that right should be done according to the laws and customs of the realm and that the statutes should be executed that his subjects may have no cause to complain of any wrong or opposition to their rights and liberties." But the Commons refused to be satisfied with an answer so vague and indeterminate and prepared a remonstrance. Finally the king yielded and gave his assent in a manner acceptable to the Commons on 7 June 1628. The petition, after reciting various statutes recognizing the rights contended for, declared that taxes, forced loans, benevolences, gifts, etc., should no longer be demanded by the king without the consent of Parliament; that soldiers should not be billeted upon the citizens without payment; that no freeman should be imprisoned except by the law of the land; and that martial law should not be proclaimed in time of peace.

The Petition of Right Act of 1860 assures the petitioner the privilege of proceeding against the Crown at common law, or he may file his petition with the Secretary of State, upon which the king's fiat that right be done may be issued on the merits of the petition, the Crown thus accepting the defense. This privilege was extended to Ireland in 1873, but has never been bestowed upon Scotland.

PETÖFI, or **PETON**, pé'tê-fi, **Sandor (Alexander)**, Hungarian poet: b. Kis-Kőrös, comitat of Pesth, 1823; d. near Schässburg, 31 July 1849. He was a common soldier for some two years and for a time a subordinate member of a troop of strolling players. His first published collection of verse (1844) established his national fame as a poet. He was less fortunate as a novelist. In March 1848 he came forward as a patriotic leader of the youth of Pesth with

the celebrated 12 national requisitions and made the revolutionary cause triumphant for the time. His spirited lyric 'Talpra, Magyar' ('Up, Magyar') was everywhere sung, and was the first of a series of patriotic verses. In 1848 he joined the Honvéd, and served with distinction under Bem. He is believed to have perished in the battle of Schässburg, though his body was never found, and doubts were long entertained as to his being really dead. He banished false rhetoric from Hungarian poetry, and much of his own work attained a true folk-character. He was a very prolific writer, and in the six years 1844-49 he published 10 volumes of poems, besides producing a countless number of minor writings. There are renderings into English by Sir John Bowring (London (1866); Loew, W. H., 'Gems from Petöfi and other Hungarian Poets' (New York 1881), and Phillips, Henry J. (Philadelphia 1885). There are also numerous translations in German and other languages. The best critical edition of his work is that by Haras (1894). Consult biographies in Magyar by Zilahy (1864) and Vutkovics (1883); Bubenik, 'A Petöfi, eine Skizze seines Lebens und Dichtens' (1882); Fischer, 'Petöfis Leben und Werke' (1889); Ferenczi, Z., 'Petöfi: Poète de la Liberté' (Budapest 1912).

PETOSKEY, pe-tös'ki, Mich., city, county-seat of Emmet County, at the mouth of Bear River, on the south shore of Little Traverse Bay, an inlet of Lake Michigan, and on the Pere Marquette and the Grand Rapids and Indiana railroads, about 191 miles north of Grand Rapids and 35 miles south of Mackinac. It has steamer connections with the lake ports. It was settled in 1874 by white traders and missionaries; incorporated in 1879 and chartered as a city in 1895. It is in a lumber region, but the surrounding cleared land has been converted into productive farms. The chief manufacturing establishments are lumber works; leather works, which employ about 150 persons; fibre and paper mills, 125 persons; woodenware works, 75; lime works, 110; other industries about 200 more. The delightful summer climate attracts thousands of visitors which necessitates extensive hotel accommodations and the employment of many persons during the season. It has the Lockwood Hospital, 11 churches, public and parish schools and a public library. The two banks have a combined capital of \$160,000, and the annual amount of business is over \$1,000,000. The county offices are housed in the new \$30,000 city hall. The government is vested in a mayor and a board of public works, a council of eight members, who hold office two years. The population is composed of a majority American born, a number of Germans, a few Armenians, Indians, Hungarians and Poles. Pop. (1920) 5,064.

PETRA, pē'tra, in Aramaic, called Rekem, and in Hebrew Sela, a ruined Nabataean city of the land of Edom, northern Arabia, in the eastern part of Arabia Petraea, to which it gave that name. Its great importance was as a trading place and station on the caravan route between Syria and Arabia up to the 4th century A.D. A century later it had disappeared from the annals of human history and even its site was unknown until 1812 when Burckhardt dis-

covered it in the Wadi Musa. The ruined city lies in a narrow valley which is surrounded on all sides by lofty mountains, embracing an area about one mile in length and half a mile in width. One of the striking characteristics of the place is the carving upon the perpendicular faces of the cliffs of ornate fronts of temples and tombs. The interiors of these excavated rooms, however, are scarcely more than caves, bare of any attempt at ornament or even finish. A great "treasure house," an amphitheatre, convent, citadel and palace have been found, mostly of late Greek architecture, but with evidence of Egyptian and Oriental influences, also in the older remains. The city was captured by Amaziah of Judah in the 9th century B.C.; became the property of the Nabataeans in the 3d (or 2d) century B.C., was made tributary to Rome in the 1st century B.C., and in the 2d century A.D. became capital of a Roman province, Arabia Petraea. It was a Christian bishopric during its last years. Consult Buhl, H., 'Geschichte der Edomiter' (Heidelberg 1893); Burckhardt, J. L., 'Travels in Syria and the Holy Land' (London 1822); Dalman, G. H., 'Petra und seine Felsheiligtümer' (Leipzig 1905); Duc de Luynes, 'Voyage d'Exploration a la Mer Morte, a Petree' (Paris 1875); Hornby, E., 'Sinai and Petra' (London 1901); Palmer, E. H., 'The Desert of the Exodus' (Cambridge 1871).

PETRARCH, pē'trärk (Italian, PETRARCA, pā-trär'kä), **Francesco**, Italian lyric poet and scholar: b. Arezzo, 20 July 1304; d. Arqua, near Padua, 18 July 1374. Soon after his birth the family moved to Avignon, France, and here the lad received his early education, going later to institutions at Montpellier (1319-23), and thence to Bologna, where he studied law during the period 1323-25. Though he pursued his profession with success, his own inclinations led him to devote much time to the Latin and Provençal poets. He returned to Avignon, where he came into a small inheritance which gave him freedom to pursue his favorite studies. His talent for Latin poetry commended him to the court of Pope John XXII, and he took minor orders in the Church. It was at this time that he first saw in the church of Saint Claire (1327) the Laura who exercised so great an influence on his future life, and was his inspiration in his most famous works. The identity of this personage, and whether she was a real or ideal one, has been much disputed, but she is generally believed to have been the 19-year old wife of Hugues de Sade, and the story is that she was so embarrassed by the passion of Petrarch that she rebuked him in public. Pope Benedict XII conferred on Petrarch a canonry at Lombez (1335). In 1336 he embarked at Marseilles for Rome, the antiquities of which he visited with an enthusiasm which he has recorded in his poems. In 1337 he returned to Avignon and bought a small estate at Vacluse. He remained here for three years and wrote numerous sonnets which acquired popularity even before the earlier and longer work of Dante (still in manuscript), and served to fix the Italian language. These were, however, only his recreation. He rested his hopes of fame on his Latin scholarship. Virgil, Cicero and Livy were his favorite authors, but he was a diligent explorer of the monasteries

for old manuscripts of all the Latin classics (he did not learn Greek till comparatively late in life), which he transcribed with his own hand, and diffused as much as possible, while he formed a precious collection of his own. In his search he traveled widely through France, Germany, Italy and Spain, making many discoveries, which have placed his name high among the restorers of letters, and preserving through his copies invaluable manuscripts which otherwise would have been lost to the world of letters. He had advanced views for his age of history and science, despising legends and astrology, and recommending true research. In politics his views were equally advanced. In religious matters he had no sympathy with the skepticism common among the scholars of his day. His Latin works, both in prose and verse, were highly esteemed, and in 1341 he was called to Rome to receive on Easter-day (8 April), the crown of laureate of the civilized world, awarded him for his Latin epic, 'Africa,' a work of real eloquence. He was subsequently charged with various diplomatic missions, and in 1342 appointed joint ambassador with Rienzi to Clement VI to solicit his return to Rome. He praised the enterprise of Rienzi (1347) in a Latin epistle, and went to Rome, though too late, to support him. At one time he thought of shutting himself up in a monastery, and determined to live more in accordance with his ecclesiastical profession. In 1353 he returned to Italy, where his repute led to his employment in many important diplomatic negotiations. He was consulted by the Pope and the emperor. In 1354 he negotiated a peace between the republics of Genoa and Venice in the name of Giovanni Visconti of Milan. From this time, with the exception of embassies to France and Germany, he lived entirely in Italy, and until 1366 chiefly at Milan, Padua and Venice, to the last of which he presented his library. In 1370 he took up his residence at Arquà, near Padua, where he passed his remaining years in religious exercises. He had two natural children by an Avignon lady—a son who died before his father, and a daughter who married Francesco de Brossano, a Milanese gentleman, who became his executor. Petrarca left no works in Italian prose. Among his Latin works are three books of 'Epistles' ('*Epistolæ Familiares*') and 12 'Eclogues,' his epic poem 'Africa,' various philosophical, religious, political and historical treatises, as '*De Officio et Virtutibus Imperatoris*'; '*De Remediis utriusque Fortunæ*'; '*De Vita Solitaria*'; '*De Vera Sapientia*'; '*De Contemptu Mundi*'; '*Itinerarium Syriacum*' (a geographical work), and '*Epitome Vitarum Viror Illustrium*.' His Italian poems consist of 'Sonetti' and 'Canzoni in Vita e in Morte di Laura,' and of 'Trionfi.' The first edition is dated Venice, 1470. The subsequent editions are innumerable. They may be found translated into English by various hands. The 'Trionfi' are in *terza rima*. Despite their refinement and delicacy of sentiment and purity of language, the sonnets of Petrarch are somewhat dull and monotonous. They are also filled, according to the taste of the age, with conceits, artificial refinements of sentiment and plays upon words. Petrarch's learning was very great, and, for his time, critical. He despised the vulgar tongue of Italy, but as the champion

of national unity wrote in that tongue such celebrated patriotic poems as the canzone 'Spirito Gentil.' As a writer of Latin he ranks among the best of modern times and shares with Boccaccio the credit of having restored classical scholarship. He is placed by suffrage of the Italians as among their poets second to Dante only. (See PETRARCH'S SONNETS). Consult Lord Woodhouselee, 'An Historical and Critical Essay on the Life of Petrarch' (1810); Campbell, T., 'Life and Times of Petrarch' (London 1843); Cayley, C. B., 'The Sonnets and Stanzas of Petrarch' (London 1879); Koerting, G. C. O., 'Petrarca's Leben und Werke' (Leipzig 1878); Longfellow, H. W., 'Poets and Poetry of Europe' (New York 1855); Mézières, A. J. F., 'Petrarque' (Paris 1896); Robinson and Rolfe, 'Petrarch, the First Modern Scholar' (New York 1898).

PETRARCH'S SONNETS. The Sonnets of Petrarch, written and often revised during the years between 1327 and 1374, cannot be properly understood without reference to Petrarch the scholar, whose earnest study of classic authors then known by little more than their names gave him philosophic breadth and humanistic sympathy far in advance of the narrow and dogmatic teaching of mediæval scholastics and dowered him with a delicacy of diction and a wealth of mythological imagery that gained him the delighted appreciation of his own generation and helped establish him as a master for several generations of romantic lyricists. Nor can we enter fully into the spirit of these centuries-old love poems without a sympathetic knowledge of the man himself, a scholar of genuine and, for his generation, surprising intellectual attainment, yet a singularly winning, affectionate human being, with a lively interest in all that concerned those near him, and an admirable capacity for loyal and enduring friendship. The constancy to a relation so entirely one-sided as Petrarch's passion for Laura, the lady of his verse, seems not uncharacteristic of the man who said, "After you have once decided upon a friend, there must be no doubt concerning the friendship. . . . There must be no mistrust, no fear."

The term "Sonnets," in the case of Petrarch, has been loosely applied to that verse which is the expression of the poet's love passion. As a matter of fact, Petrarch employed as his instrument not only about 300 sonnets, but a number of poems in looser verse form, variously styled, and six long poems entitled the 'Trionfi' or 'Triumphs,' celebrating the successive victories over each other of love, chastity, death, fame, time and eternity. To the entire collection he himself gave the name, 'Canzoniere' or 'Song Book.' As everyone knows, this volume of verse is, with the exception of a few occasional poems, inspired by the lady whom Petrarch names Laura. Whether Laura, under either this or another name, really existed is a matter of dispute among scholars. Beyond suspicion of forgery are the records made by Petrarch of his meeting with her, and of her death 21 years later. Yet no indisputable evidence confirming her identity exists, and Petrarch's constant play on the name Laura, likening it to Laus (renown) and Laurel, the meed of the successful poet, gave rise, even among his own contemporaries, to the accusa-

tion that the lady of his aspiration was merely the personification of the poet's literary ambitions. However, it would seem impossible for anyone reading the Sonnets with sympathetic attention to give such an impersonal interpretation to them. They certainly lack definite information concerning Laura. Other than that she is lovely to look upon, with golden hair, and lashes and eyebrows of jet, that her bearing is modest and dignified, and that she is endowed with a spiritual grace that is at once the inspiration and despair of the poet, she is without attribute. But that this is so by no means disproves the actuality of her existence, and it most assuredly does not disprove the reality and poignancy of the emotion aroused through her in the soul of Petrarch. The quality of this emotion and the mood and philosophy to which it gave rise can be more clearly understood after an examination of the poems themselves to discover the poet's method and the scope of his artistic range.

Exclusive of those which deal with other matters, the Sonnets begin with chronicling his first encounter with Laura at the age of 23, and his helplessness, as a naked youth, against love's dart, which found entrance through his eyes and transfixed his heart. From that moment, he is love's captive, borne on, as by a steed heedless to bridle or spur, to that laurel whose flower aggravates the pain that it should heal. This comparison of Laura to the laurel is one of many figures employed. Now she is a sun, shedding the light of her eyes on him to waken him into new life; she is a flame and he the fated moth; she is the enchantress who transforms Petrarch himself into a laurel whose constant green defies the changing wintry blasts. She is dire winter, on her eyes hang the cloud, in her heart is unyielding ice. Again, such fire burns in her eyes that he melts as snow and would fain assuage his pain by death. Sometimes she is not Love but Love's opponent. Because his "two loved lights (Laura's eyes) their wonted aid restrain," Love rides the poet's ship, desire mans every oar, and, while "Reason and Art lie dead amid the storm," he himself is borne by the wet wind of his own sighs and tears through the fog of disdain to destruction. The figure of his lady's eyes acting as beacons of safety and a guide to higher things is often employed, and with the passage of years and the deepening of the poet's passion takes its place as a symbol of that spiritualizing influence exerted by her to which he so often and especially after her death pays tribute. In her presence lust died, in her regard was a heavenly grace worn only by the blest in realms on high.

The above, translated almost literally from passages throughout the poems, indicates how entirely subjective is their content. They celebrate not the lady but the moods, the thought, the reflections aroused in the poet by the sight and memory of her. Her presence causes him unspeakable joy, while at the same time it creates unendurable desires. She unfits him for serious work, even as she inspires him to nobler ends. The lover and poet would rejoice in this manifestation of human loveliness did not thwarted passion demand toll, while monastic tradition frowned in angry reproof. Entirely sincere are Petrarch's pleas that heavenly aid

deliver him from the "mortal loveliness" that "seized and soiled" his soul. Yet quite as sincere is the expression of his grief and loneliness after the death of Laura, his longing for her presence, and the comfort that dreams and visions of her bring.

This dualism or antagonism of thought and utterance became the keynote of the horde of Petrarchan imitators that followed in Italy, France, England and Spain. With them it was almost entirely a matter of form, the contrasting moods of the poet or lover being simply material out of which to fashion what are known as "conceits," highly elaborated and in crude hands highly absurd figures of speech. With Petrarch, however, sophisticated as he is, and in style polished almost to the point of preciousness, there is a profound basis of feeling and an irreconcilable spiritual paradox. It is not enough to recall that, whatever the impediment, Petrarch's love was not returned. Mere possession of the loved one might have brought passing joy to Petrarch the man. But there would still remain unsatisfied Petrarch the idealist, the mortal conscious of his dross, of his eternal inability to remain at one with the divine. From this arose the restlessness, the self-conflict, the recurrent stand against that love which now inflamed him with holy zeal, now fanned desire and the pursuit of self-gratification. A disciple of Augustine, he could not but believe such imaginings and affections were unholy things, even as his intellect, founded on the calm philosophy of the Stoics, resented the beauty that "spoiled his mind of judgment and from freedom's lofty path so drew him." Yet the very nobility of the object of his desire was to him both as idealist and lover sufficient justification for its continued pursuit.

The type of imagery employed by Petrarch has been indicated. To this factor in artistic effect may be added his many charming descriptions of nature. In this there is nothing of marked originality or intimacy. Fresh-leaved woods, fountains, sweet air, are usually but a background, sympathetic or the reverse, to the mood of the poet. The attitude of the writer is again subjective, his range of observation distinctly limited. But read in the light of Petrarch's many-times avowed preference for the peace and beauty of the country, and his actual choice of it as a residence, these expressions of appreciation are added confirmation of the sincerity of his feeling and its utterance.

A complete critical edition of Petrarch's verse was made in 1896 by Giovanni Mestica. His lyrics were edited by Carducci and Ferrari in 1899, and by Salvo-Cozzo in 1904. The 'Trionfi' were edited in 1901 by Carl Appel. A number of English poets have translated individual poems. These translations have been collected into a convenient volume issued by George Bell and Sons of London in their Bohn library.

CLARA DELISSA BERG.

PETREL, any of the smaller species of a group of oceanic birds allied to the albatrosses, characterized by webbed feet and tubular nostrils. In the albatrosses the tubular nostrils of the two sides are quite distinct, while the fulmars, shearwaters and petrels proper have them united to each other and to the base of the bill,

and are, therefore, placed in a distinct family the *Procellariidæ*. Most of them also have the hallux much better developed than have the albatrosses. The wings are long and pointed, the tail short but of various shapes, and usually with 14 or 16 quill-feathers. Owing to its compactness and oiliness the plumage is extremely resistant to water. The feet are small and completely webbed in front. The fulmars and shearwaters are relatively large birds, the petrels proper of small size and distinguished by the prominence of the nasal tube and the more or less hooked beak. Except during the breeding season the petrels never voluntarily come on land, and seldom even approach the shores, but remain out at sea even during the most severe storms. Sailors call the smaller ones, indiscriminately as to species, Mother Carey's chickens. Probably 75 species are known, many of which have a wide range. They feed on small marine animals and on almost any kind of food-refuse cast overboard from ships, and appear exceedingly fond of fat or grease, for which, and for other edibles, they will follow in the wake of vessels for great distances, and for many days continuously, and often collect in great numbers where food is plentiful. When irritated they vomit an oily fluid of highly offensive odor.

These birds breed in large communities in localities adjoining the sea, forming their nests in holes, usually in the face of a cliff, but often in burrows or cavities which they dig for themselves or appropriate from rabbits and other burrowing animals. Where the earth is hard and digging difficult several females will lay in the same burrow. The female lays one egg. They are not often seen near shore in the daytime, remaining hidden in the nest and going abroad for food at night. They fly rapidly, and generally close to the water; and when in pursuit of food they suspend themselves by extending their wings, and appear to run on the surface of the water. It is from this circumstance that they are called petrels ("little Peters"), after the apostle Peter, who walked on the water. The appearance of these birds is considered by seamen to presage a storm—hence the common name of a familiar species (*P. pelagica*) known as the "stormy petrel"—and it is thought peculiarly unlucky to kill one of them. The largest representative of the group is the Giant Fulmar of the southern seas. This bird has a wing spread of six to seven feet. In northern waters the largest is the fulmar petrel, a bird about 20 inches in length. Owing to their wandering habits most of the species are likely to be seen occasionally in North American waters, where fully 15 species of true petrels, besides as many more shearwaters and fulmars, have been actually recorded. The best-known on the North Atlantic Coast is Leach's petrel (*Cymochorea leucorhoa*), a pretty little bird in black with a white rump, which skims the waves with the most marvelous skill and seems never to tire. It is barely six inches long and one of the smallest of water birds. Wilson's stormy petrel (*Oceanites oceanicus*) is one of several petrels characterized by their long plover-like legs. It is one of the most widely dispersed and commonest species on the high seas. The diving petrels are a distinct group, belonging to the family *Pelecanoididæ*. These

birds are eight to nine inches in length, and they are numerous in the waters about Australia and New Zealand. They have become famous from their habit of diving at full speed through the crests of waves. Consult Baird, Brewer and Ridgway, 'North American Water Birds' (Boston 1884); Knowlton, F. H., 'Birds of the World' (New York 1909); Salvin, 'Challenger Reports' (Vols. II and IV, London 1881-82).

PETRIE, pē'trē, William Matthew Flinders, English Egyptologist, grandson of Matthew Flinders (q.v.), the Australian explorer: b. Charlton, 3 June 1853. He received a private education, and in 1875-80 devoted his attention to British archaeology, the results appearing in the works, 'Inductive Metrology, or the Recovery of Ancient Measures from the Monuments' (1877), and 'Stonehenge: Plans, Description, and Theories' (1880). He then went to Egypt, making a careful survey of the pyramids of Gizeh, of which he published an account in 'The Pyramids and Temples of Gizeh' (1883). He continued his work in Egypt under the auspices of the Egypt Exploration Fund Committee (1884-86); excavated the site of Tanis, and discovered and excavated Naukratis, Am and Daphnæ, his results being published in 'Tanis' (1885-87), 'Naukratis' (1886). In 1894 he founded the Egyptian Research Account and was instrumental in enlarging the British School of Archaeology in Egypt in 1905. He has continued his explorations of ancient sites, his excavations forming the theme of the works 'Hawara' (1889); 'Tell el Amarna' (1895); 'Koptos' (1896); 'Denderah' (1900); 'Diospolis' (1901), and 'Royal Tombs of the Earliest Dynasties' (1901), etc. Among other publications are 'A Season in Egypt' (1888); 'Racial Portraits' (1888); 'Historical Scarabs' (1889); 'Ten Years' Digging in Egypt' (1893); 'A History of Egypt' (2 vols., 1895-97); 'Egyptian Tales' (2 vols., 1895-99); 'Egyptian Decorative Art' (1895); 'Religion and Conscience in Ancient Egypt' (1898); 'Syria and Egypt' (1898); 'Diospolis' (1901); 'Abydos' (1902-03); 'Ehnasya' (1904); 'Researches in Sinai' (1906); 'Hyksos and Israelite Cities' (1906); 'Gizeh and Rifeh' (1907); 'Athribis' (1908); 'Personal Religion in Egypt' (1908); 'Memphis' (1909); 'Qurneh' (1909); 'Arts and Crafts in Egypt' (1909); 'Egypt and Israel' (1911); 'Tarkhan' (1912-13); 'Amulets' (1914); 'Heliopolis' (1914); 'Scarabs' (1917); 'Tools and Weapons' (1917). Since 1892 he has been professor of Egyptology in University College, London.

PETRIFICATION, literally to make into a stone, specifically the replacement of organic substance by mineral matter in such a way that the minute details of structure are preserved. The petrification of wood with the preservation of the grain is a familiar example. The common statement that petrification and fossilization are the same is not strictly true, since some fossils are merely the imprint of the organism, such as the tracery of fern leaves in coal beds. Silica and calcium carbonate are the most common substances to replace organisms. See FOSSILS.

PETRIFIED FORESTS. See FORESTS, PETRIFIED.

PETROBRUSIANS, followers of Pierre de Bruys, who in Languedoc, during the 12th century, founded a sect of religious extremists. His tenets included the rejection of infant baptism, the abolition of church music, the destruction of church buildings, the disuse of the cross as an object of veneration and a denial of the Real Presence in the Eucharist, whose elements were, he said, mere symbols; and strenuously opposed all prayers and services offered in behalf of the dead. For 20 years his doctrines were propagated with fiery zeal, and the number of his followers in southern France rapidly increased. Peter, abbot of Cluny, wrote a treatise to refute him, and he incurred the anger of the people by the demolition of altars and churches, and in 1124 was burnt to death by the mob at Saint Gilles, near Nîmes. The Petrobrusians as a sect disappeared in the closing years of the 13th century.

PETROGRAD, a government of Russia, formerly Saint Petersburg, now Leningrad. Situated in the northwest of Russia, Petrograd is bounded on the north by Finland and the gulf of that name; area, 17,226 square miles of land and 3,534 square miles of water surface; population in 1914, 3,136,500, of which number 2,133,100 were at that time located in the city of Petrograd. On the west lie the republics of Esthonia and Livonia; south and southeast those of Pskov and Novgorod, respectively. Petrograd includes Lake Ladoga (the largest in Europe, nearly 7,000 square miles), Lake Peipus and the Neva and Narova rivers. The flat and generally marshy surface is nearly half covered with forests and almost a quarter with waste lands, unsuitable for tillage. Little effort has been made to render the ground available for cultivation; potatoes, flax, rye, barley and oats are grown, mainly for local consumption. The waters—including the gulf—supply an abundance of fish. Cotton weaving is an important industry, while the other industries and manufactures are the same as those carried on in the city of Petrograd. Much trade is transacted at the numerous fairs which are periodically held in almost every town and village. Its early history is almost parallel with that of the city, though the whole territory did not become Russian till 1721, or 19 years after Peter the Great had conquered the site on which the capital stands. Two communes belonging to the province of Viborg (Finland) were detached in 1911 and added to Petrograd, which was thus enlarged by about 600 square miles.

PETROGRAD, formerly Saint Petersburg, now LENINGRAD, former capital of Russia in the government of Leningrad, situated on the delta of the Neva, at the head of the Gulf of Finland, in 59° 57' N. lat. and 30° 20' E. long., 400 miles northwest of Moscow, the ancient capital, and 1,400 miles from Odessa. The city covers an extensive area embracing the banks of the river bordering the mainland as well as numerous islands formed by the many branches of the Neva, about 30 feet above sea-level. The principal portion is on the right bank; the other parts are built on the islands, which are connected with each other and the mainland by numerous bridges. The Neva, which flows from Lake Ladoga near Schlüsselburg, empties itself into the Gulf of Finland

after a course of 43 miles. It enters Petrograd near the convent of Saint Alexander-Nevsky, describing a great arc about 10 miles long and dividing into several branches—Great or Bolshaya Neva, Little or Malaya Neva and the Great and Little Nevka. The principal navigation is on the Great Neva, but there are numerous sand-banks where only vessels of low draught can pass. Inundations not infrequently occur; the strong southwest winds at times raise the Neva considerably and causes it to overflow its banks. On such occasions cannon-shots from the citadel warn the people of the coming flood. Between the Great Neva and the Little Neva lies Basil Island (Vassili Ostrov), a part of which (Golodai Ostrov) is again cut off by the narrow Smolenskaya River. The next largest island is what was formerly called the Peterburgsky Ostrov, on which the Alexander Park and Zoological Garden are situated, separated by a canal, Kronversky, from the fortress of Saint Peter and Saint Paul, which stands on an island connected with the mainland by the Troitsky Bridge. The other islands are Aptekarsky Ostrov (Apothecary's Island), Kamenny Ostrov (Stone Island), Yelaghine Ostrov, Krestovsky Ostrov, Volny Ostrov, Petrovsky Ostrov, Gutuijevsky Ostrov, Krugly Ostrov and several smaller ones. Of the bridges only three are permanent; others are built on boats (pontoons) and removed periodically, especially when the ice descends from Lake Ladoga. Some 200 canals have been constructed to receive the overflow of the river and the melting ice and snow in the spring. The canals are spanned by granite and iron bridges, with a draw-bridge in the middle. Lying on low, marshy ground, the climate is extremely variable, cold and damp; rain and snow fall for over 150 days in the year. Spring commences late; snow often lies till May, and about the middle of that month the first green begins to appear. June, July and part of August there is agreeable weather. During September and the first half of October the temperature is fairly regular. Altogether, Petrograd enjoys barely three and a half months of pleasant weather. The average temperature in July is 64° F. and in January 15° F., when all the waterways are frozen over. The time in Petrograd is seven hours ahead of New York. The banks of the principal canals are protected by solid walls of granite, and the quays of the Neva are necessarily more substantial than those of any other European city. Great forests extend to the very confines of the city in one direction, while marshy bogs are characteristic everywhere. Petrograd comprises 12 districts or quarters (chásti), subdivided into 38 arrondissements or police precincts. The most important section of the city is that south of the Admiralty, from which the principal streets radiate. With few exceptions the streets are wide and commodious; the sidewalks are narrow and most of the roads are roughly paved. The streets are divided into three classes: "prospect," equivalent to the New York "avenue"; úlitza, cross-street, and "pereúlok," or third-class thoroughfare. Of the "prospécty" the most famous is the "Nevsky Prospéct," which shares with Princes street in Edinburgh (Scotland) the distinction of being the two finest streets in the world.

PETROGRAD, RUSSIA

1 The Cathedral of Saint Isaac

2 The Column Alexander and the Admiralty

Many travelers, indeed, award the palm to the Nevsky Prospekt. Other prominent thoroughfares are the Voznessensky Prospekt, Liteiny Prospekt, the Vladimirsky Prospekt, Gorokhováya Ulitsa, Morskaya, Milliónnaya, Sadováya, Kazánskaya and Koníuchénnyaya. These streets contain the palaces of the court and nobility and of the better classes. Owing to the swampy nature of the ground the main buildings are generally erected on wooden piles in large plots. This part of the residential district on the south bank of the Neva occupies the peninsula or the Bólshaya or Great Side; that on the north bank, including the islands, Petrograd (formerly Peterburgskaya). Across the Alexander Bridge lies the district of Viborg. The Peterburgskaya section contains the commercial and business district and also the important docks and warehouses, the stock exchange (birzha), scientific institutions and numerous schools and colleges. The old fortress of Saint Peter and Saint Paul on Peterburgsky Island faces the Winter Palace, and contains the Mint (Monety Dvor) and the ancient cathedral (sobór) where all the Russian sovereigns except the last one are buried with their families. Here are political prisons—generally crowded—behind which stands the arsenal, and in the wide streets are the houses where the minor government officials dwelt before the revolution cut off their functions. Many of the islands contain attractive parks and summer houses of the wealthy. The old Admiralty, founded by Peter the Great in 1705, stands in the midst of a spacious square enclosed by trees on three sides. Near it are grouped the principal buildings of the capital, which include the "Glavny Shtab" (head-quarter staff), containing the Foreign Office and Customs Department; the War Department (Voyénnoye Ministérstvo) the cathedral, the Senate and the Synod, and nearby the equestrian statue of Peter the Great, erected by Catherine II. On the right is the huge Winter Palace, an immense quadrilateral block erected in the middle of the 18th century. It was rebuilt after having been destroyed by fire in 1837. It is the largest palace in the world and was a city in itself when formerly occupied by the imperial family, accommodating 6,000 people. Its fine halls are rich in statuary, paintings and gems of art, including the tables of rare malachite. The great court ceremonials were held in this palace, and in its treasury were preserved the costly crown jewels. The Hermitage, a classical edifice built by Catherine II, but reconstructed in 1840-50, contains one of the richest artistic and archæological collections in the world, including sculptures and masterpieces from all the famous schools of painters. In Petrovsky square stands the cathedral of Saint Isaac, built of granite and marble, whose five gilded domes are conspicuous from all parts of the city. It is of almost cubic form and void of any artistic beauty, though its peristyles of colossal red granite monoliths create a striking impression. Rich in interior decorations, its paintings represent Russian art for over a century. On a large square south of the cathedral stands a monument to Nicholas I, a rather stiff Doric column; there are other monuments to Catherine II, one commemorating the Russo-Turkish War 1877-78, etc. The

arsenal contains a museum of artillery; the Academy of Sciences has an extensive museum and art collection and a library of 350,000 volumes. The "Imperial" Library is one of the most valuable in the world, containing considerably over 1,000,000 volumes and many priceless manuscripts, besides some 100,000 engravings. Catherine II purchased the library of Voltaire and added it to the collection. Besides other theatres, there are four in which plays and operas are rendered in different languages. Scattered all over the city are lofty watch-towers used for signaling danger by fire or water. The general style of architecture—apart from the purely Russian—is nondescript and lacks the picturesque element—masses of architecture in endless lines, often gorgeous, but frequently tasteless. There are about 400 churches; besides those mentioned are the cathedral of Our Lady of Kazan, celebrated for its Napoleonic trophies; the church of Saint Alexander Nevski; the church of the Smolnoi, convent and the church of the Preobrazhenskaya, rich in military trophies. The chief scientific and educational institutions, of which there is a vast number and variety, include the University, the Ladies' University, the Mining Institute, The Imperial Academy of Medicine, the Technological Institute of Nicholas I, Medical College for Women, Polytechnic College for Women, besides a great number of art, music, literary, mining, military and scientific institutions which make Petrograd one of the great intellectual centres of the world. Despite this, the percentage of illiteracy for European Russia is as high as 70. About 150 newspapers were published in Petrograd before the revolution. The palaces not already referred to are the Marble, Taurida (where the Duma met), Annitchkov—a favorite residence of the late Tsar, and the new Michaelov Palace, one of the most elegant buildings in the city. The government buildings are remarkable for their enormous size. There are numerous hospitals, dispensaries, convalescent homes and charitable institutions. Among the more important of the manufactures are those of Gobelin tapestry, glass, porcelain, military surgical instruments, articles of malachite and precious stones, machinery, embroidery, etc. There are great iron-works, shipbuilding yards, breweries, distilleries, sugar refineries, textile mills, factories for the preparation of tobacco, silk, cotton, leather, paper mills, clock, watch and jewelry works, and various other industries. The commerce of the city is enormous; six railroads converge there; nearly half of the entire shipping trade of the country passes through the ports of Petrograd and Kronstadt, the latter 16 miles distant (connected by canal), where the large vessels unload. Increased railway facilities have developed internal traffic and trade to a remarkable extent. A great grain-producing country, Russia exports thousands of shiploads through Petrograd to northern Europe. The war and the subsequent revolution in 1917 have so disorganized the trade of Petrograd that all former statistics are now obsolete and meaningless.

Tsárskoe-Seló (Tsar Village), 22 versts (16 miles) south-southeast of Petrograd, is a summer resort of society. It contains two castles, eight churches, several barracks, hospitals, etc.,

and has a population of 24,000. Peter the Great had a residence here, and since his time it has been the favorite summer residence of Russian sovereigns. The Old Palace (Stáry Dvorets) is an immense building in rococo style erected under Elizabeth and Catherine II, and internally decorated with extraordinary magnificence. The New Palace (Nóvy Dvorets) was built by Catherine for her grandson, Alexander I, and contains a valuable library and a military museum. A fine theatre in Chinese style stands in the Alexander Garden. Several German communities are scattered around the environs. Peterhof, also a former imperial residence, is situated on the southern coast of the gulf about 20 miles from the city and contains a magnificent palace begun by Peter the Great in imitation of the palace at Versailles.

The population of Petrograd in 1914 was 2,133,100, and in 1915, it was 2,318,645, of which number about 75 per cent was Russian; the remainder was made up of Poles, Finns, Germans, Jews and other nationalities. After Moscow was made the capital of Russia, Petrograd lost a large percentage of its population. By far the bulk of the population—over 80 per cent—professed the Orthodox faith; less than 10 per cent was Protestant, and about 4 per cent Roman Catholic. In 1800 the population was 220,000; in 1864 it was 539,120; it rose to 1,870,000 in 1908 and in 1913 it was 2,318,645.

History.—The territory between the Gulf of Finland and Lake Ladoga was inhabited by Finns and Slavs during the 9th century. Swedes settled at the mouth of the Neva in 1300, and during the next four centuries the land changed hands several times, but remained most of the period in possession of the Swedes, from whom it was reconquered by Peter the Great in 1702. He laid the foundation of the city in May 1703; the first brick house was built in 1710, and in 1712 the seat of empire was transferred hither from Moscow, by which move Peter transformed Russia (Muscovy) from an Oriental into an Occidental power. He forced Western civilization upon his subjects by relentless methods, compelled them to help in the building and development of the capital by residing there, and obliged every vessel arriving to carry stones in her cargo to build the walls and pave the streets. All the stone had to be transported to the site, which was at the time a desolate, unhealthy Finnish marsh. A great fire in 1736 destroyed 2,000 houses; another in 1780 destroyed over 11,000 houses, and in 1796 a conflagration devoured government magazines, naval stores and many vessels. The last great fire was in 1862. The railroad to Moscow was completed in 1851; to Berlin in 1862. Apart from local disturbances, such as revolutionary riots, Petrograd has no stirring history like the other and older European capitals. In 1901 and 1902 revolutionary demonstrations were rigorously suppressed, and the Putiloff iron-works strike in January 1905 led to the events of "Bloody Sunday" (22 January), when thousands of workmen approached the Winter Palace headed by the notorious Father Gapon to petition the Tsar for redress of their grievances. The troops fired on the crowd and hundreds were killed. On 1 Sept. 1914 the old

name of Saint Petersburg was abolished by imperial ukase on account of its German derivation, and that of Petrograd substituted, a name that had already been used for many years by non-Russian Slavs, and which was consequently not new. The wildest scenes ever witnessed in Petrograd broke out early in 1917 and developed into the great revolution which swept away the Romanov family, broke the military power of Russia and eliminated her from the war as a belligerent. For nearly four years anarchy and wholesale murder prevailed in the city under the Kerensky and Bolshevik régimes, and in the Spring of 1921 there was no indication that the city was likely to settle down in the near future to normal life under a stable government. See KERENSKY; LENINE; RASPUTIN; RUSSIA; RUSSIAN REVOLUTION; TROTSKY; WAR, EUROPEAN.

Editorial Staff of The Americana.

PETROGRAPHY, the science which deals with the description of individual rock formations. In modern methods the microscope and chemical analyses play a conspicuous part. Strictly considered, petrography confines itself to the study of the rock specimen *per se*, while the study of the field relations and of the origin of the rock falls more properly under the science of petrology. The two are, however, often used synonymously, and often interchangeably with lithology. The latter term, however, is preferably limited to the discussion of rock material as distinguished from other natural substances.

PETROLEUM, the general name applied to one of the three great classes of natural oily liquids, the other two being the essential oils and the fixed oils. (See OIL). It is obtained ready formed from the earth and from various localities. It belongs to a great series of bodies grouped under the name "Bitumens" which together comprise a range of materials of the highest importance to the well-being of the human family. The familiar bitumens are the gaseous natural gas, the liquid, petroleum, the semi-liquids, maltha and asphalt pitch, and the solids, natural asphalt and ozokerite. The word is derived from the Latin, *petra*, rock, and *oleum*, oil, and literally means rock oil. It is also known in some parts of the world in its crude state as naphtha, derived from the Persian "nafata." As used in the United States the term "naphtha" is applied only to one of the lighter products which is given off in the process of distillation. In Germany it is known as "erdoel" or earth oil and "steinoel"—stone oil; the French and Italian equivalent is "petrol." Crude petroleum varies in specific gravity over a wide range. This characteristic of petroleum and its products is usually expressed in degrees Baumé, a type of hydrometer which found favor in the early days of the industry. Its readings are directly reducible to specific gravity through use of the formula $\frac{140}{130 + B^{\circ}} = \text{Sp. Gr.}$ Water is

10° Baumé. One of the heavy crudes from Wyoming approaches this gravity, while the amber varieties from Pennsylvania are as light as 46° to 48° Baumé. Most of the paraffin crudes (see classification below) take fire on application of a flame, at ordinary temperatures, due to the gasoline content. Others, like the natural West Virginia black oils, must be heated to 180° F. or above before they will give off inflammable vapors rapidly enough to produce a flash. Certain crudes are not frozen at 0° F., while others containing larger percentages of paraffin solidify at temperatures only slightly below normal. In color petroleum ranges all the way from a light straw through amber, red and brown to jet black. The transparent oils also exhibit a variety of color by reflected light.

Crude oils have been variously classified, preference now being given to naming them from the group of hydrocarbons representing the largest proportion of the crude. Nearly all contain percentages of the paraffins, of the olefins or ethylenes, of the naphthenes, and of various other bodies in smaller proportions, but because of the variable proportions of these groups, certain ones having strongly marked characteristics have been chosen as types and the two generally recognized are differentiated by Holde as: (1) the naphthenes, and (2) the paraffins. The first are those that are rich in naphthenes, low in paraffin (from 0 to 1½ per cent), containing little naphtha as well as very little kerosene but much lubricating oil, and frequently asphaltic bodies: Most of the California crude and that from the Gulf Coastal fields of Texas and Louisiana are properly naphthenes. They have been also called asphalt base crudes. Asphaltic or asphalt-bearing crudes would be a better designation. The paraffins or paraffin base crudes contain smaller quantities of naphthenes, larger proportions of paraffin, ranging from 3 per cent to 8 per cent, considerable amounts of naphtha and illuminating oils, and both light and heavy lubricating oils, the relative yields of the latter depending somewhat on the method of distillation. The Pennsylvania crudes are the best of this type. There are various grades between these two as well as those containing sulphur or pitch-like bodies or both. Some of the more recent writers are confining the term "asphalt" to the naturally existing body and the names "mineral" or "artificial pitch" to the semi-fluid product of petroleum used as an adulterant of the natural asphalt.

Geographical Distribution of Types.—

The former divisions of the petroleum producing areas into rather definite sections in the United States are being disregarded because of the widening areas of such fields, and the separation has come to be based more and more on fundamental differences in the type of oil produced and its adaptability to refining needs. Thus the oils of the Appalachian fields are in the main paraffins free from objectionable sulphur and asphalt and they yield by ordinary refining methods high percentages of gasoline and illuminating oils. Contrasted with them is the petroleum of the Lima-Indiana fields which contains some asphalt though consisting chiefly of paraffin hydrocarbons, and is contaminated with sulphur compounds which necessitate

special treatment for their elimination. Illinois oils contain varying proportions of both asphalt and paraffin and differ considerably as to specific gravity and distillation products. Sulphur is generally present but rarely in such form as to necessitate special treatment for its removal. Mid-continent oils vary in composition within wide limits, ranging from the naphthenes containing asphalt to the paraffins in which the asphalt content is negligible and which yield correspondingly high percentages of the lighter products of distillation. Sulphur is present in varying quantities in the lower grade oils, in certain of which, Healdton, for example, it exists in the form requiring special treatment for its elimination. Oils from the Gulf field exhibit a considerable variety, but many of the naphthenes are characterized by relatively high percentages of asphalt. Considerable sulphur is present, much of which, however, is in the form of sulphureted hydrogen and is easily removed by steaming before refining or utilizing the oil as fuel. Oils from Wyoming and Colorado are in the main paraffin hydrocarbons suitable for refining by ordinary methods. Certain of the naphthenes containing large percentages of asphalt and suitable only for use as a fuel are also obtained in the Wyoming fields. The California oils exhibit a variety of compositions, none of them containing hydrocarbons of the paraffin series and all of them containing more or less dense, asphaltic hydrocarbons. The phenols are a common constituent of the denser oils; many of them also contain sulphur. The chief products are fuel oils, illuminating oils, lubricants and artificial asphalt, though low percentages of naphthas may be derived from certain of the lighter oils, notably those of the Santa Maria, Sespe and Santa Paula fields in the southern part of the State. Canadian petroleum, like that from the Appalachian field, is classed as a paraffin.

Chemistry.—Much work has been done in determining the actual chemical formulæ of the various hydrocarbons found in crude petroleum and its distillates, and many in the series of certain types have been identified. CH_4 is marsh gas or methane, the first of the series of the paraffins which have the general formula of $\text{C}_n \text{H}_{2n+2}$. Pentane, C_5H_{12} , is one of the lowest boiling point paraffins of commercial importance. It also has a low freezing point for which reason it is used instead of alcohol in thermometers for measuring very low temperatures. A "straight run" kerosene of this series contains a large percentage of tridecane, $\text{C}_{13}\text{H}_{28}$. One of the paraffin waxes having the unusual melting point of 167° F. is chemically $\text{C}_{32}\text{H}_{72}$. The members of this series are said to be saturated because the chemical bonds—linkages—are all satisfied. The olefins or ethylenes which have two unsatisfied linkages are unsaturated, and are soluble in sulphuric acid. This characteristic is made use of commercially in sweetening and deodorizing kerosene by treating with that acid. The olefins, named from olephant gas, C_2H_4 , the first member of the series, have the general formula C_nH_{2n} , and with the paraffins are known as open chain hydrocarbons. The naphthenes or cycloparaffins have the same chemical composition as the olefins but differ widely from them in physical characteristics, the theory being that the naphthenes are closed

chains or closed ring hydrocarbons, in which the grouping of the elements in the molecule is not the same as that in the chain.

Mabery, whose studies of the petroleum have been of great scientific value, has identified members of the groups C_nH_{m-2} , and C_nH_{m-4} in oil from the Trenton limestone in Ohio. The next series C_nH_{m-4} is represented by the aromatic hydrocarbons, benzol, toluol and xylol. They are found only in small percentages in Pennsylvania crude but certain of the petroleum from the Far East yield such appreciable quantities that they are being worked as a substantial source of supply of the aromatics. The aromatics are chiefly collected in the distillation of bituminous coal for the manufacture of gas for domestic purposes, but because of the adaptability of some of them to use in high explosives, such as picric acid and trinitrotoluol, "T.N.T.," it has become necessary to secure them from every available source.

Origin.—The question of the formation of petroleum is of great chemical as well as geological interest. The older hypothesis that petroleum was formed entirely from inorganic reactions has been modified during recent years through continued studies of the optical rotatory power of the crude oil (See POLARIZATION OF LIGHT) and for geological reasons. Such hypotheses were suggested by Mendeléeff and by Sabatier and Senderens. According to Mendeléeff petroleum resulted from the action of steam on carbides in the interior of the earth; according to Sabatier and Senderens hydrogen and acetylene (resulting from the action of water on alkali and alkaline earth metals and carbides) by contact with metallic bodies, acting as catalyzers, formed aliphatic and cyclic derivations according to conditions. The hypotheses proposed more recently favor in general the formation from organic material. This view is supported by the work of Biot in 1835 on the optical rotatory power of crude oil to which attention was again drawn by Walden and by Tschugajef and has recently been carefully studied and confirmed by Rakusin, by C. Engler and others. Differences of opinion exist as to whether the petroleum is derived from animal or from vegetable material, or from both. C. Engler first showed by experiment, after Hofer had concluded from geological evidences that petroleum was derived from marine deposits, that an artificial petroleum could be obtained by the distillation of fats. He carried out his experiments with the fat of marine animals. According to the theory of Engler, petroleum is formed from the fatty remains of all kinds of life after decomposition under pressure, and after the other accompanying matter (protein substances) has changed by putrefaction into water, soluble nitrogen and sulphur derivatives. The lighter hydrocarbons resulting from vigorous treatment of fatty acids (adipocere) containing paraffins, ethylenes and naphthenes are supposed to have polymerized to those of higher boiling points in the course of long geological period. Marcusson, thinks that the higher boiling point fractions of petroleum could not have formed from the same volatile portions, because the former have a greater optical rotatory power than the latter. The opposite view would seem to him the more reasonable one. Many of the bituminous deposits

in nature, however, seem to point to a gradual transition from natural gas through the petroleum to the semi-liquid or more solid bodies. All the great pools of petroleum have been found immediately below impervious strata of the earth's crust. Where this crust has faulted, pressures from below, either gaseous, aqueous or from sheer weight of the earthy material, have forced the more plastic bodies to the surface where the transition has taken place. It cannot be stated that any one theory has found universal acceptance and it seems quite plausible that different kinds of petroleum may have been produced from different materials.

Geological Distribution.—In the Appalachian field the petroleum yielding strata belong to the Carboniferous and Devonian systems, the most productive including the Mahoning sandstone and the Bradford "third oil sand" immediately underlying the Devonian shale. However, every well-defined and persistent sandstone, discovered below the Pottsville conglomerate, has produced oil or gas in paying quantities. In Kansas and Oklahoma they are generally found in Carboniferous sandstones. The principal oil horizon of Canada is confined to the Corniferous limestone, still older than the Devonian shales; in Indiana and Ohio, the Trenton limestone is the chief source of oil and gas; in Colorado, northern Texas and Louisiana it is found in the Cretaceous; in California chiefly in the Miocene Tertiary; in southern Texas and southern Louisiana, in association with salt domes which also carry limestone and gypsum, while in Europe it is found in the Tertiary.

Early Uses of Petroleum.—The use of petroleum, in its semi-liquid and solid forms, was common among the ancient nations of the East. The "slime" noted in the Old Testament, as employed in the construction of the Tower of Babel, was, without doubt, partially evaporated petroleum. The ruins of Nineveh and Babylon reveal its use as a bond in cementing structures of brick at least 2000 a.c. Herodotus, the Greek historian, mentions the oil springs on the island of Zante and the asphaltic deposits, which were carried down by the river ls and collected by the early Babylonians. Bitumen was an article of commerce in the region of the Dead Sea and was transported into Egypt and sold for embalming purposes centuries before the time of Christ. "Sicilian Oil" obtained from natural springs near Agrigentum, on the island of Sicily, was burned in the lamps of the temple of Jupiter about the beginning of the Christian era. This is the earliest record of petroleum being used for illuminating purposes. A Roman general built a bridge across the Danube about the year 100 A.D., near the city of Severance. The piers were of brick, cemented with bitumen. Two of these ancient piers remain to this day on the banks of the Danube, in which the outer layers of brick have crumbled away, leaving the black pitchy matter protruding. Historical references to the early knowledge and use of petroleum in Galicia, Persia, India, China and Japan are very numerous. The "holy fire" from the naphtha and natural gas springs of the Apscheron Peninsula, on the borders of the Caspian Sea, has been known and worshipped by certain sects among the Persians for from 2,500 to 3,000 years.

On the western continent this important mineral product was known to the aborigines centuries before the discovery by Columbus. The presence of pits, excavated for the purpose of collecting oil, along the waters of Oil Creek and French Creek, bear witness to this fact. Many of these were from six to eight feet square and varied in depth from 4 to 12 feet. They were lined with heavy timbers and were always to be found in the valleys and along streams where natural seeps of petroleum existed. They were not constructed by the Senecas or other Indian tribes that occupied the territory, when the first white man appeared in America. They were, doubtless, the work of the same race of people who developed the copper deposits of Lake Superior, the lead ores of Lexington, Ky., and built the great mounds in Ohio and other of our Western States.

The earliest mention of petroleum in the United States was in 1627 by a French missionary, who described the famous petroleum spring near Cuba, in western New York State. The first mention of petroleum in Pennsylvania was by a Moravian missionary who visited the region in 1767 and described the petroleum bubbling up in springs and from the beds of creeks, accompanied by natural gas. Many subsequent travelers, who penetrated the almost unbroken wilderness in after years in southwestern New York, northwestern Pennsylvania and southeastern Ohio, mention the existence of petroleum and natural gas. These explorers were guided to these localities by the Indians, who usually collected sufficient petroleum from the surface of the streams for a fire. This phenomenon was regarded by them with religious awe and superstition.

The artesian well driller, in search of salt brine in subsequent years, demonstrated the existence of petroleum in greater or less quantities, accompanied by natural gas, both of which were considered a source of annoyance and danger, over a large area in the Ohio Valley reaching from Freeport, on the Allegheny River in Pennsylvania, to Burkesville, in southeastern Kentucky, and from the waters of Duck Creek, in Washington County, Ohio, to a few miles above Charleston, on the Big Kanawha in West Virginia. The last-named locality has the distinction of containing the pioneer salt brine well of the United States, which was drilled by the Ruffner Brothers in 1808. They employed the most primitive appliances, but successfully cased off the weaker salt brine, adopting methods that are now employed in sinking deep artesian wells of every kind. About the year 1810 the first salt wells were drilled at Tarentum, Pa., followed by those on the Big Sandy, on the borders of Kentucky, which also produced considerable petroleum and natural gas associated with the salt brine. About the year 1829 a well was drilled for salt near Burkesville, in Cumberland County, Ky., which struck a great reservoir of petroleum; the oil flowed into the Cumberland River nearby, caught fire and produced a conflagration on the surface of the river for nearly 50 miles. For a number of years after, this well continued to flow, and a portion of the product was bottled up and marketed under the title of "American Medical Oil, Burkesville, Ky."

From the year 1848 to 1856 Mr. Samuel Kier, of Pittsburgh, Pa., bottled the petroleum

produced from the salt wells at Tarentum and sold quantities of it for medicine under the name of Seneca Oil, which name has been given it from the oil produced by the celebrated spring near Cuba, N. Y., whose product was also sold for medicinal purposes.

A portion of the petroleum from these wells was used in its crude state for illumination, but, because of the smoke and offensive odor, it was unfit for burning indoors. Mr. Kier of Pittsburgh, Pa., also made a number of experiments and succeeded in manufacturing an illuminating oil, but, owing to the crude and imperfect methods employed and the faulty character of the lamps, it did not become popular as a source of artificial light. In the meantime other minds were at work on the problem of supplying the world with a cheap, safe and efficient illuminant, to take the place of the beeswax and tallow candle and the greasy whale oil lamp, which were then the common sources of artificial light in general use. The decline in the whale-oil industry, owing to the growing scarcity of the animals in the high seas, threatened the total extinction of the supply of sperm and whale oil.

The Shale Oil Industry.—To meet the emergency, manufacturers turned their attention to the shale-oil industry, which had already made considerable progress in Scotland and some other parts of Europe. By distillation it was found possible to extract a rich paraffin oil from the bituminous coal shales and out of this was manufactured a very fair grade of illuminating oil. The first patent for refining coal oil (as it was called) was granted to James Young of Manchester, England, in 1850.

The same process was patented in the United States in 1852. Dr. Abraham Gessner patented his illuminating oil, which he called "kerosene," and was obtained from the same sources in 1854. By 1859 the shale-oil industry had made considerable progress and there were nearly 60 establishments engaged in its manufacture. It was the progress made by this industry that paved the way for the almost instant success of refining crude petroleum. But the discovery of the latter in commercial quantities at Colonel Drake's experimental well in 1859 rendered the laborious process of obtaining a crude distillate from the shale rocks no longer necessary and speedily brought about the abandonment of the shale refineries. A number of them immediately took up the new discovery and adapted their works to the manufacture of illuminating oil from the crude product that they secured from the Pennsylvania oil regions. Between 1853 and 1860 four large distilling plants for the manufacture of shale oil were erected on the Allegheny River, near Freeport, Pa., eight miles above Tarentum. A number of factories were established along the New England coast, which used the boghead coal, obtained in Scotland, for distilling purposes. Albertite, from Nova Scotia, was employed in some Maine establishments, and several manufacturing were erected in the interior for distilling oil from the Breckenridge cannel coal obtained in Kentucky and from the Grahamite deposits of West Virginia. The principal points of manufacture were at Canfield, Ohio; Ritchie Mines and Peytonia, W. Va., and Cloversport and Maysville in Kentucky.

Distribution of Petroleum.—The United States leads the world in the production of petroleum as well as in the manufacture of refined oil. For several years it was surpassed by Russia, but recent discoveries of enormous supplies in the Mid-Continent region together with the rapid development of the California oil fields have placed the United States once more in the first rank of oil-producing countries. Outside the United States, petroleum is obtained in commercial quantities in other countries ranking in production in the following order: Russia, Mexico, Dutch East Indies, Rumania, India, Japan and Formosa, Peru, Germany, Trinidad, Argentina, Egypt, Canada and Italy.

Petroleum in the United States.—For years the world was almost dependent upon the oil fields of Pennsylvania for its supply of illuminating oil and the American product dominated the markets of the world. Developments gradually extended to the Northeast and Southwest, taking in several counties in the lower part of western New York and covering large areas of territory in West Virginia and southeastern Ohio. Then followed the discovery of oil in the Trenton limestone formations of northwestern Ohio and Indiana. Up to the year 1901 almost the entire production of the United States came from five States east of the Mississippi, namely—New York, Pennsylvania, West Virginia, Ohio and Indiana. In 1901 the wonderful petroleum fields in Texas were opened up and California and Kansas came into prominence as producing sections. At the present time the production of the Western States surpasses that of the Eastern, and while the original territory producing paraffin base oil appears to be on the decline there are immense fields opening up west of the Mississippi. In 1907 Oklahoma advanced at once to the first rank as a producing territory, going beyond California, notwithstanding the fact that during that year she increased her production nearly 20 per cent. Oklahoma held second place in 1923, while Arkansas, Texas, Louisiana and Illinois have shown marked developments. Wyoming also has become a foremost producer.

A table prepared under the direction of the Secretary of the Interior, published in February 1916, estimates that the oil fields of the country are exhausted to an average of 32 per cent, based on the present method of production, but that the fields already being worked can reasonably be looked to for the production of an additional 7,629,000,000 barrels of crude petroleum. A competent authority stated in July 1917 that, "this country is producing oil at the rate of about 300,000,000 barrels a year, but it is using it at the rate of about 335,000,000 barrels per year." For several years the United States has produced over 400,000,000 barrels annually; the 1922 production was 551,197,000 barrels.

In 1910 there were 400,000 automobiles in use in the United States. In 1916 the number was 2,250,000. In 1923 there were more than 14,000,000 cars, demanding more than 5,400,000,000 gallons of gasoline a year and other uses of gasoline and oil are expanding upon an enormous scale.

Casing-head Gasoline.—While the enormous quantities of natural gas gasoline being recovered from the great natural gas fields will go far to make up the shortage, it is apparent

that the gasoline situation is becoming acute. At the present rate of consumption all the surplus stocks of crude oil above ground will not become exhausted while production is increased in a substantial percentage, or methods are discovered under which more of the petroleum can be obtained from the oil sand. In all States in 1919 there were 230 plants which produced 274,092,952 gallons of raw gasoline from natural gas. Much of it was obtained from casing-head, oil-well or "wet" natural gas, and both by the compression and condensation and the absorption methods. The former is the familiar one applied to liquifying gases. The absorption method is carried out in two ways. In one the gas is bubbled through an oil of higher boiling point than gasoline like a 300° F. fire test burning oil, until it will no longer absorb all the suspended gasoline. The oil is transferred to a still, where it is heated and the gasoline recovered by ordinary fractional distillation. In the other the gas is absorbed directly into a naphtha of higher boiling point until the mixture is brought down to or below the boiling point of commercial gasoline. This grade is then steam stillled or weathered to remove the excess of light ends boiling below 140° F. "Gravity" is no longer a safe guide in choosing a gasoline for automobile use, because a mixture of a casing-head gas and kerosene in the proportions to make a 70° gasoline might contain so much low boiling material as to interfere with carburation and make it unsuitable for engine fuel. The ideal fuel contains enough low boiling point fractions for easy starting and not so much "heavy end" as to interfere with instantaneous combustion of the atomized mixture.

It is easily understood that this casing-head gasoline is, therefore, becoming of commercial importance not only as a conservancy of fuel but because it makes possible the use of naphthas too heavy for service alone as an engine fuel, by raising the boiling point of the mixture to a satisfactory degree. It adds to the available supply besides its volume the quantity of heavy naphtha not otherwise usable for the purpose. It is estimated that the entire value of commercial gasoline represented by the output of casing-head gasoline for 1919 amounted to approximately \$43,919,664. Natural gas containing as low as one pint of gasoline per 1,000 cubic feet is now profitably treated. Casing-head gas contains as high as 3.6 gallons per thousand cubic feet.

The Drake Discovery.—Previous to 1858 nothing had been accomplished toward establishing the fact that petroleum existed in almost inexhaustible quantities and that large supplies could be obtained by simply drilling wells into the rocky structure of the earth. The natural petroleum had been analyzed by eminent chemists, its properties as an illuminant had been pretty well established and in a small way it had become an article of commercial exchange. Its production, however, was confined to collecting it by various crude and imperfect methods from the oil springs and streams that bore petroleum on their waters, in various parts of the country. It was obtained in considerable quantities from the salt wells of Tarentum, Pa., and the lower Allegheny Valley, and it was gradually finding a market in Pittsburgh and New York for various pur-

poses. On 4 March 1858 nine barrels of oil from Tarentum were shipped to the Kerosene Oil Company at New York City and sold for \$275.19. From such small beginnings rose an industry that was to revolutionize the methods of artificial lighting in general use and add millions of dollars to the combined wealth of the United States.

The Pennsylvania Rock Oil Company, the first of its kind, was organized in New York in December 1854 by George H. Bissell and Jonathan D. Eveleth. They were prosperous New York attorneys, who had become interested in petroleum, and had secured some land on Oil Creek from Brewer, Watson and Company, a firm of lumbermen operating a lumber mill below Titusville, Pa. Their first idea was to collect the oil from the surface springs and they hoped by systematic work to secure it in sufficient quantities to market it in the East. Professor Benjamin Silliman, Jr., of New Haven, Conn., had made an exhaustive analysis of the samples of oil submitted to him by Messrs. Eveleth and Bissell, and his report confirmed their highest expectations as to the value of the product. The efforts of the company to obtain petroleum by such primitive methods proved far from successful, and another company was formed in Connecticut for the same purposes. It took over the property of the New York concern and later on was succeeded by the Seneca Oil Company, in which Col. E. L. Drake of New Haven became interested. Drake was sent to Titusville, Pa., in 1858, and shortly after commenced preparation for drilling an artesian well in order to tap the hidden sources of the oil supply in the underlying rocks. He encountered many trials and difficulties, his partners lost faith in the enterprise and he was compelled to strain his own resources to the utmost in order to continue the project. His persistency was rewarded and on 28 Aug. 1859 the first oil well in the United States began producing at a depth of 69½ feet. The oil rose to within 10 feet of the surface and when the well was equipped for pumping it produced for a short time about 40 barrels a day. The product sold readily at 50 cents a gallon or about \$20 a barrel. The news of the wonderful discovery spread over the country and created the greatest excitement. The production of the Drake well during the last four months of 1859 and the first four months of its existence is estimated at 2,000 barrels. Another well was completed near Rouseville, farther down Oil Creek, in December 1859, which pumped about eight barrels a day.

Hundreds of wells were then started in the Oil Creek Valley and up and down the Allegheny River, and the rush to engage in the new industry resembled greatly the excitement that followed the discovery of gold in California in 1849. Oil was found the following year at Tidioute, Henry's Bend, Franklin and Smith's Ferry, Pa., and the production of the year 1860 amounted to over 500,000 barrels. Most of these wells were drilled only to the first sand, as the upper producing formation of the Venango group is commonly termed, and dry holes were numerous in territory that in after years proved highly productive from the deeper sands.

In 1861 the first flowing well was struck

on the Funk farm, near Rouseville, Pa. It was 400 feet in depth and the oil was obtained in the third sand. This well was followed by others that spouted from 2,000 to 3,000 barrels a day. The market was overstocked and prices went down to the lowest point known in the history of the oil industry. The estimated production for 1861 was 2,113,609 barrels, but thousands of barrels flowed upon the ground and were carried away by the waters of the Oil Creek and the Allegheny River.

The oil developments, which were at first confined to the lowlands along the valleys of Oil Creek, French Creek and the Allegheny River were rapidly extended in all directions and test wells in search of the hitherto little-known product were drilled miles away from the original strike. An era of oil stock companies ensued, which came to an end in 1866-67 after causing heavy losses to the people of this country, amounting to many millions of dollars. The rise and fall of Pithole occurred during this period, which was almost duplicated a few years later in the history of Petroleum Centre. Both were flourishing towns in Venango County, Pa., but the exhaustion of their big wells and the removal of their population to fresh centres of oil development caused their whole or partial abandonment. At present Pithole is nothing but a memory, while the name of Petroleum Centre is still preserved by a flag-station on the Pennsylvania Railroad, between Oil City and Titusville, Pa.

From Venango County the oil developments were extended southward into Clarion, Butler and Armstrong counties, and within 15 years after the Drake strike production had risen to nearly 30,000 barrels a day. In December 1874 the initial well of the great Bradford oil field in Pennsylvania was opened up, but it was not until 1878 that the exodus of lower country operations to the prolific districts of the Northeast began in real earnest. For three years this new district, which covered over 100,000 acres, extending from Cattaraugus County, in New York State, through the central portion of McKean County, Pa., was the centre of an unparalleled activity. New wells were drilled and production increased at a rapid rate, beyond the ability of the pipe-line companies to take care of the oil. In July 1880 the production of the Bradford field reached 100,000 barrels a day, but not more than 80,000 barrels were run into the storage tanks of the transportation companies. The remainder ran to waste. The same year the developments in Allegany County, in New York State, began to attract attention, and it likewise proved a very rich and prolific source of oil production. Stocks were steadily increasing during this time, and prices going down, but there was no cessation of drilling operations. Bradford and Allegany were followed by the discovery of the Cherry Grove district in Warren County, Pa., which came into prominence during the summer of 1882. It furnished a number of spouting wells, such as the oil country had not known since the development of the fourth sand belt in Butler County, about 10 years previous. The pool, however, was quickly drilled over and the "gushers" declined to pumping-wells of small calibre. Cherry Grove was followed by Cooper and Balltown, both of which produced a large amount of petroleum and helped swell the con-

stantly increasing stocks in the custody of the pipe-lines. These three last-named pools obtained their oil from white sand formations, similar to those of Venango and Butler counties, but they were found at a greater depth and of a different geological horizon. The Bradford and Allegheny oil is found in a dark, chocolate-colored formation commonly known as the "black sand" to distinguish it from the white. These sands are all found below the regular Venango group, which was the first and only oil formation known to the early drillers and operators. With the advent of the Cherry Grove field in 1882, oil declined to less than 50 cents a barrel, and the steady accumulation of the stocks made the outlook very discouraging for the oil producers. By August 1884 the gross stocks had reached over 40,000,000 barrels and its depressing influence upon prices of crude petroleum was freely admitted by everyone. In 1884 another big white sand development was opened up in Washington County, Pa., and the attention of oilmen was again attracted toward the Southwest. These developments were extended into West Virginia and southeastern Ohio, and for many years have proved the sources of a great supply of high-grade petroleum. In 1891 the phenomenal oil-field at McDonald, in Allegheny and Washington counties, Pa., was opened up and ran the production for that year up to the largest amount that had ever been recorded. Mannington and Sisterville, in West Virginia, were the next pools of importance, and they were followed by others in succession, all of which helped to maintain the supply.

For years the production of Pennsylvania oil had steadily exceeded the demand, stocks continued to accumulate and the price ruled very low. In 1887 the market declined from an average of 71 cents in January to 59½ cents in July. A movement among the oil producers was then started which resulted in the formation of the Producers' Protective Association, and an agreement was entered into to stop drilling new wells and shut in a third of the daily production. The object was to get rid of some of the surplus stocks and increase the price of oil at the wells. The movement proved a remarkable success. The net pipe-line stocks which at the close of July 1887 amounted to over 32,000,000 barrels, by the close of December 1888 had become reduced to 18,604,474 barrels. The production for the year 1888 showed a decline of over 5,000,000 barrels from that of the previous year. At the same time it was over 9,000,000 barrels less than the consumption and the market value of the oil, which averaged 66½ cents per barrel in 1887, increased to 87 cents in 1888 and 94½ cents in 1889.

Trenton Rock Oil Fields.—For nearly 30 years Pennsylvania had maintained her position as the leading oil-producing State of the country, and during the first 10 years after Drake's discovery had been the source of the world's principal supply of illuminating oil. In 1885 oil was discovered in the Trenton rock at a well drilled for natural gas, near Lima, Ohio, which proved the beginning of the developments in northwestern Ohio and Indiana. This oil was of different quality from that produced in Pennsylvania and was impregnated with sulphur. It, however, had a paraffin base, but its value for illuminating purposes was not

at once established. For many years it was marketed as a fuel oil, the supply being very much below the demand. When a process was found for converting it into an acceptable illuminant its market value was considerably enhanced. The production of northwestern Ohio, which amounted to 1,079,025 barrels in 1885, in 11 years increased to 20,575,138 barrels, and at the close of 1896 there was a surplus stock of over 25,000,000 barrels. Indiana came into prominence as an oil-producing State in 1891 and grew in importance until it reached its highest production in 1904 with a yield of 11,339,124 barrels. The production has gradually diminished, and in 1922 it was only 1,084,000 barrels. The Indiana oil is of the same general character as that of northwestern Ohio and comes from the same Trenton Rock formation. The yields from Kentucky and Tennessee are usually grouped because the quantity from the latter State has been so small. The oil from both States is of paraffin base though heavier in specific gravity than the usual run from the Appalachian field. Kentucky produced in 1922, 8,981,200 barrels and gives promise of even greater yields for the future.

West of the Mississippi.—Oil has been produced in California since 1876, but not until 1895 did it reach the million barrel mark. In 1903 California advanced to first place as a producing State, which position it held, except the years 1907 and 1908, continuously until 1915 when its production of 86,591,535 barrels was surpassed by the 97,915,243 barrels produced by Oklahoma. In 1923 it was again ahead of every other competing State. The product is marketed largely for fuel purposes for the railroads of the Southwest, for steamships, including those of the navy, and for manufacturing purposes. The production is chiefly asphaltic, in some respects similar to that from the Gulf Coastal field, all of which are now classified as naphthene base oils. The percentage of illuminating oils and gasoline is small, but the lubricating oil manufactured from these crudes is of good quality.

For commercial purposes it is customary to group under the title Mid-Continent field, the areas of oil production in Kansas, Oklahoma, northern and central Texas and northern Louisiana. For many years the oil territory in Kansas was confined to a small area around a refinery at Neodesha, in Wilson County, where a small refinery was erected and connected with the wells by pipe-lines. The developments were gradually extended, but no great volume was produced until 1903 when the yield was 932,214 barrels. The next year the record was 4,250,779 barrels, and Oklahoma also became a million-barrel State. The production in the latter State increased so enormously that its yield of 43,524,128 barrels in 1907 exceeded the California yield by more than 4,000,000 barrels. Its production for 1915 was 97,915,243 barrels, again exceeding California, but a banner year was 1922 when the yield was 146,631,000 barrels. The first refinery in this field was built in 1892; the second one in 1904, and since that year, with the increased production, many refineries have been erected. In 1916 there were 71 independent and three Standard Oil Company refineries in operation, with an approximate investment of \$107,000,000 and consuming upward of 208,000 barrels of crude per day.

One of the results of the enormous production in this field was the laying of pipe-lines so that the crude oil could be delivered to the large refineries of the Standard Oil Company at Whiting, Ind.

Texas.—Oil was discovered in Texas in 1867, the first development having been located about 15 miles south of Nacogdoches. About 100 wells were drilled and a pipe-line built to the nearest railroad. This oil was of fair lubricating quality, but the yield was very small and the field quickly lapsed into disuse. In June 1894 in the process of drilling an artesian well for water near Corsicana, a good flow of oil was struck at a depth of 1,027 feet. The oil was cased off and the well continued down to 2,470 feet where a good flow of warm water was encountered, but no more petroleum revealed itself. This was the beginning of the first successful oil development of any commercial importance in Texas. It was over two years later before outside capital was attracted to this district which in 1897 was credited with a production of 65,975 barrels. This was increased until it reached the maximum of 28,136,189 barrels in 1905. The yield fell off for the several succeeding years but started upward in 1911, and in 1922 it was the third in order of quantity produced with 116,670,000 barrels. The great oil field in southeastern Texas was opened up in January 1901, when a well drilled on Spindletop, near Beaumont, in Jefferson County, started to flow at 70,000 barrels a day and proved the forerunner of developments that soon placed the Lone Star State in the front rank of oil-producing sections of the world. Oil is obtained from two formations in this State, in the northern and central portions from strata, in the former from sandstone belonging to the upper Carboniferous, and in the central from sandstones or other porous rocks of the Cretaceous and Tertiary, and in the Coastal plain from domes associated with rock-salt and gypsum. Here the reservoir rock is generally either porous dolomitic limestone or sandstone ranging from the Cretaceous to the Quaternary.

Louisiana.—Oil was discovered at Jennings shortly after the opening of the prolific field in southeastern Texas. In 1911 the State produced more crude than the combined production of Pennsylvania and New York. Some of the largest wells in the country were found in Louisiana, and to the close of 1915 its yield was on the increase, that year amounting to 18,191,539 barrels. For 1922 the quantity produced was 34,171,000 barrels. The oil in the northern part of the State is from the same strata as found in central Texas; that from the southern part from domes similar to those of the Gulf Coastal Plain of Texas.

Rocky Mountain Field.—For convenience, all areas of production of petroleum in Colorado, Wyoming and Montana, as well as a number of areas of prospective production in Utah and New Mexico, are classified as the "Rocky Mountain Field." Various grades of petroleum are found both in the strata of the Carboniferous and the Cretaceous. The oils from the former range in gravity from 18° to 24° Baumé are asphaltic and are utilized chiefly for fuel. Those from the Cretaceous rocks range from 32° to 48° Baumé, are of paraffin base and in wide demand for refining.

Colorado.—The oil production of Colorado is confined to a small pool in the vicinity of Florence, and another of still more limited dimensions at Boulder. It is of dark-green color and generally of paraffin base and above 31° Baumé. It is all refined at Florence and marketed in the Rocky Mountain stations. In 1904 the production amounted to a half-million barrels, but it has almost continuously declined since that year, the production in 1922 amounting to only 97,000 barrels.

Wyoming.—The description of an expedition to Great Salt Lake written in 1864 refers to a spring of petroleum or mineral tar in the valley of Sulphur Creek. The emigrants collected it for medicinal purposes and for greasing their wagon wheels. The Carter Spring, six miles to the west, was discovered about the same time. Various other discoveries were made, but the first production marketed from drilled wells was from the Carter well in Uinta County. The first gusher wells were drilled in the Dallas field in 1883 and the first wells at Shannon on the north end of the Salt Creek field in 1880. The earlier discovered wells yielded heavy dark products chiefly valuable for lubricating purposes. Up to 1910 the production was nominal when it began to increase and passed the million-barrel mark in 1912. In 1922 Wyoming produced 26,232,000 barrels, and is becoming recognized as the dominant factor in the situation with respect to high-grade petroleum in western North America. The fact that the greater part of this yield consists of high-grade refining oil, capable of furnishing 15 to 25 per cent of gasoline by modern refining methods, indicates well for the local industry.

Montana.—In 1922 this State marketed 2,369,000 barrels of petroleum from the districts that had been developed commercially.

Utah.—The few wells developed in this State yielded in 1916 15,200 barrels. Plans were also made by two companies in 1917 for the erection of experimental plants for the distillation of oil shale which promises to become an important industry.

The quantities above given are in barrels of 42 gallons each and represent marketed production taken from government reports. In practically every State at the time these figures were compiled the actual production from the wells was greater, the difference going into storage tanks and not being available for publication. In some States this storage is now being drawn on, and as stated in another section of this article, at the present rate the accumulated surplus is keeping ahead of consumption.

Production.—In the older fields where the oil wells are drilled through stratified rock, the ordinary method of procedure, after locating the well, is to sink a shaft, the same as for a water well, or to drive down a wooden or iron "conductor" through the soil nearly or quite to the bed rock. When the rock has been reached, the real drilling is begun with a string of tools consisting of rope socket, drilling jars, drill stem and bit. Various sizes of the latter are at hand and the one selected to start the hole with may be anywhere from 8 inches to 12 inches in diameter, depending on the known rock formation. The drill is raised by mechanical means and allowed to fall of its own weight, thus crushing its way through the strata until water is reached. An iron pipe or casing

is then placed in the drill hole in such a manner as to exclude the water and below this point a drill of smaller size is used until water is again encountered. A pipe of smaller size is fitted within the first casing and this procedure repeated until the oil sand is reached. Usually it is unnecessary to case the lower part of the drill hole. Just before the producing oil sand is reached is a layer of impervious shale. Unless the oil starts flowing immediately, it is customary in some sections to continue the drilling for several feet into the oil-bearing sand, and after due preparation explode a charge of nitroglycerine at the bottom of the drill hole, which shatters the surrounding rock, forming a cavity in which the oil can accumulate. This cavity is then cleared of debris, and the pump, with all its appliances, placed in the well which is started on its career as an oil producer.

In several sections of the United States, particularly in Texas, the nature of the soil is such that cave-ins occur and the drill hole has to be carried down by other means. The rotating pipe method has been very useful for this work. The lower end of the drive pipe is supplied with a cutting tool on the plan of saw teeth and as the pipe is rotated it quickly cuts its way through the soft soil. These cuttings are removed from the drill hole or well by forcing downward through the inside of the drill pipe a stream of water. This passes out below the bottom of the cutting edge and floats the cuttings to the surface. When the line of rotating pipe is sunk to its length in the ground, another run is screwed into its upper end and this plan carried on until the well reaches either the oil sand or some obstruction requiring a different tool. With the use of different cutting edges, the rotating pipe can be forced through rock that is reasonably hard, and in the hardest strata the drilling is carried out by lowering steel shot into the bottom of the well and grinding this into the rock by means of the rotating pipe. The cone of rock within the tube is broken off frequently and brought to the surface.

In the Mid-Continent fields where gas is met at varying depths when in search of oil, a modification of the rotary method has come into use which has proven of great utility both in conserving the natural gas as well as in overcoming the troubles incident to the bubbling of the gas through the water or mud-laden fluid used in putting down the well. This modification consists in mixing in a separate tank from 5 to 15 per cent of clay with water and pumping this mixture down through the drill and catching it again when it comes up outside the casing, allowing it to pass through a separate tank where the drill cuttings drop out and the mud-laden fluid again returns to the tank from which it is circulated. The clay deposits as a thin layer of mud over the loose strata from which the gas flows into the well and eventually so fills the openings as to effectively shut out the gas. The pressure necessary to force this fluid down is estimated to be from 500 to 600 pounds per square inch in a well 1,000 feet deep and increasingly greater in deeper wells. The depth of oil wells naturally varies in different fields, but it is noteworthy that the Drake well, the first one drilled, was but 69½ feet deep and may be con-

sidered remarkable in many ways. Some of the West Virginia wells, drilled into the fifth sand, approach 3,400 feet in depth.

Transportation.—The crude petroleum from the Oil Creek Valley was first transported down Oil Creek and Allegheny River in barrels on barges to Pittsburgh, where it found a ready market. The barrels were of oak with iron hoops holding about 42 gallons each, which doubtless is the origin of the unit of capacity still in use in tabulations of petroleum and its products. It was also hauled overland in wagons to Union City and Garland, where the barrels were loaded on cars for shipment by rail, to points East and West. The boats loaded with empty barrels were towed up the creek by horses or mules wading in the stream, there being no towpath. After filling, the barrels were again loaded on the boats which were released at the next freshet. As a matter of economy, two upright wooden tanks or cisterns, holding 2,000 gallons each, replaced the barrels on barges and platform cars, and later boats having a number of water-tight compartments took the place of barrel barges. In 1871 the wooden tanks began to disappear, their place being supplied by the horizontal, cylindrical tanks now in general use.

The first pipe-line was three miles long and was laid in 1862. It was of ordinary four-inch gas pipe with caulked joints. The leakage was so great that but little oil was delivered at destination and the line was soon abandoned. However, it existed long enough to arouse the opposition of the teamsters who had been hauling the oil out of the district and who saw, in its successful operation, the ruin of their occupation, and much rioting followed. In 1865 the first successful line was constructed and was the forerunner of this most useful method of transportation. It connected the Shaffer Farm with Benninghoff Run, was of four-inch pipe and four miles long. Now the entire production of the Eastern oil fields is handled by pipe-line systems which cover the oil country with a net-work of gathering lines that connect the small receiving tanks of the producers with the large storage tanks of the pipe-line companies. The first seaboard pipe-line was completed about 1879 and its route was from Olean, N. Y., through the southern part of New York State to Saddle River, N. J. At this point it was divided, one branch going to the Standard Oil Company's refineries at Hunter's Point, L. I., and another to Bayonne, N. J. The growth of the pipe-line has been one of the most remarkable developments in connection with the growth of the oil industry. The Transit line to New York conveyed the petroleum of the great Bradford oil field to the Eastern seaboard and supplied the markets of the world with American illuminating oil. The Tide Water pipe-line which antedated the New York Transit, did not succeed in reaching the Eastern coast until many years later. Its route was through Pennsylvania, from Bradford to Williamsport, where it halted and shipped the oil of the Bradford field in tank cars to New York and Philadelphia.

At the present trunk lines convey the product of the Pennsylvania, West Virginia, New York, Ohio, Indiana, Kentucky and Tennessee oil fields to New York, Philadelphia, Baltimore, Cleveland, Pittsburgh and Chicago. With

the line now completed from Kansas City to Whiting, Ind., it is possible to pump oil through iron pipes from the remotest sections of the Kansas and Oklahoma oil fields to the Atlantic seaboard. Of the great trunk lines now in operation, the New York Transit extends from Olean to New York, the Southern Pipe Line from West Virginia to Philadelphia, while the Buckeye Pipe Line cares for the production of the Ohio and Indiana fields. The Tide Water Pipe Line Company transports oil from the Allegany, N. Y., and Bradford, Pa., oil fields to the refineries at Bayonne and Philadelphia. The United States Pipe Line Company was the first to undertake the transportation of refined oil through pipe-lines. It has a double line, one for conveying crude and the other refined oil. It receives its supply of crude oil from the Producers and Refiners Oil Company, a gathering line, which extends through northern Pennsylvania into the oil

fields of eastern Ohio and West Virginia. Its refined oil, which it ships to New York, is obtained from the refiners of Oil City, Titusville, Warren and Bradford, Pa. There are a number of minor companies with lines that penetrate various sections of the Pennsylvania and Ohio oil regions. Pipe-lines form an important part of the transportation system in Texas and California.

These lines are of pipes of various sizes from four inches to eight inches in diameter. From Kansas City to New York, much of the way the lines are in pairs, so that the total length approaches 3,000 miles, holding approximately 760,000 barrels. This is dead capital. At the price at which Mid-Continent oil was quoted during May 1917 this had a total value of \$1,500,000.

The pipe-line is of special construction of wrought iron, lap-welded and tested to 1,200 pounds pressure. At distances of approxi-

mately 25 miles pumping stations are located. Besides the two or more large tanks for holding the crude discharged from the line is a powerhouse in which are located the great pumps for forcing the oil through the line, auxiliary pumps for various purposes, as well as steam boilers in which to generate steam for operating the plant. The triplex double-acting pump is the type quite generally used. These are supplied with a liberal number of valves, which condition together with the action of the three pistons results in forcing forward a nearly constant stream. At the next station the crude is received in one of the large tanks from which it is again pumped forward. In 1907 the rifled pipe was introduced in California for the purpose of handling the heavy viscous crudes. The rifling is about one-eighth inch in depth and makes one complete revolution in every 10 linear feet. In operation water is pumped into the line at the same time as the oil, and it follows the pipe itself, acting as a lubricant. As an indication of the capacity of these lines, the following statements are interesting: The Gulf Pipe Line Company has an eight-inch trunk line from Watkins Station to Glenn Pool, Sour Lake, a distance of 419 miles. It has a capacity of 14,000 barrels per day. The Texas Company has a trunk line eight inches in diameter from Lefebvre Station, Tulsa, to Humble, Tex., the length of which is 470 miles. The delivery capacity of this line is 15,000 barrels daily.

The statistics given in the preceding table taken from a current periodical show the vast quantities of crude petroleum being transported by the principal pipe-line companies.

Production of the United States.—The amount of marketed production in the United States during the recent years has suffered no set-back, reaching in 1922 a total of 551,197,000 barrels, value about \$800,000,000. Of this quantity four-fifths was produced in the newer fields west of the Mississippi. The actual gallonage in the Eastern fields is somewhat smaller than formerly but the great change in percentage of yield between the sections is due to the enormously increased production in the West. The following table shows the production of crude petroleum and the value by years since the beginning in 1859:

QUANTITY AND VALUE OF PRODUCTION OF CRUDE PETROLEUM, 1859-1923.

YEAR	Barrels, 42 gallons	Total value
1859	2,000	\$32,000
1860	500,000	4,800,000
1861	2,113,609	1,035,668
1862	3,056,690	3,209,525
1863	2,611,309	8,225,663
1864	2,116,109	20,896,576

Production by States.—The following figures compiled from company reports made to the United States Geological Survey show the quantity of petroleum transported from producing properties in 1922. Petroleum consumed on the leases and produced but not transported from the producing properties is not included.

	Jan.-Dec.:
Arkansas	12,097,000
California *	139,671,000
Colorado	97,000
Illinois	9,363,000
Indiana	1,084,000
Kansas	31,588,000
Kentucky	8,981,200
Louisiana	34,171,000
Montana	2,369,000
New York	1,000,000
Ohio	6,762,000
Oklahoma: Osage county	38,216,000
Remainder of State	108,415,000
Total Oklahoma	146,631,000
Pennsylvania	7,443,000
Tennessee	9,800
Texas: Gulf Coast	33,805,000
Remainder of State	82,865,000
Total Texas	116,670,000
West Virginia	7,028,000
Wyoming: Salt Creek	18,896,000
Remainder of State	7,336,000
Total Wyoming	26,232,000
United States	551,197,000

* Includes 1922 production of France, 496,000 barrels; Colombia, 323,000; Germany, 319,000; Canada, 179,000; Czechoslovakia, 120,000; Italy, 31,000; Algeria, 9,000; and England, 1,000. Total production of these countries, 1857-1922, is for France, 1,941,000 barrels; Colombia, 323,000; Germany, 15,987,000; Canada, 25,230,000; Czechoslovakia, 331,000; Italy, 1,107,000; Algeria, 50,000; England, 9,000 barrels.

Distillation and Refining.—The separation of petroleum into its various usable components is based upon the principle of fractional distillation. This is carried so far as to result in the actual decomposition of some of the constituent hydrocarbons when running crude specially for the production of gasoline and illuminating oil. In the early days of the distillation of crude petroleum the main purpose was to make illuminating oils. At that period the gasolines were worse than useless and when the stocks had accumulated to the capacity of storage, not infrequently the water-cock in the bottom of the tank would be "accidentally" left open and the naphtha, as it was then called, allowed to flow out until the tank was empty. Many disastrous fires resulted in the oil region from this practice.

Destructive or Cracking Process.—The stills utilized in distilling for illuminating oils by the destructive process are usually horizontal cylinders mounted in brickwork, much the same as steam boilers, except that the upper half of the still is left uncovered. Heat is applied by burning coal in a furnace the same as under boilers. From the top of the still a large vapor pipe, or pipes, lead to coils of pipe submerged in water held in large, shallow iron tanks called condensers; these coils end in a pipe leading to the running-room where it terminates in a boiler iron "look-box" fitted with plate-glass for purposes of observation. Leading from this "look-box" is a pipe with side outlets connecting with various tanks.

After charging the still with crude petroleum the fires are started and the lighter products known as the naphthas pass over through the vapor pipes and condenser into the running-house. Samples are taken from the "look-boxes" and weighed and when the degree Baumé is heavy enough to indicate that all the naphtha is off, the stream of distillate is conducted into another tank and allowed to run until the next lower "cut" is indicated by the Baumé degree of the sample. In this way, roughly, the naphthas of various grades and the illuminating oils are taken off. The heavier residual oil is usually then transferred to another still—"tar still"—in which distillation is similarly con-

ducted until nothing but coke remains. The heavier distillates, as the process proceeds, do not easily pass out through the vapor pipe but condense on the cooler upper surface of the still and finally fall back in drops into the hotter oil below. This results in the decomposition or "cracking" of the original hydrocarbon and the formation of additional quantities of illuminating oil distillates. When necessary the fires are increased until all of the oil has been decomposed and the carbon which was set free by the operation has collected as coke, which must be removed by picks. Formerly this coke was largely used in the production of carbons for arc lamps used in street lighting. One of its uses at present is in dry cells employed for battery ignition in motor cars.

The heavy distillates from the second stage of this process are treated with sulphuric acid in a lead-lined agitator, followed by a soda solution, and finally washed with water, are chilled and pressed for paraffin wax, which is subjected to various treatments, and is finally marketed as a white refined scale wax. The distillates from which the waxes have been removed are used in making the pale and red paraffin oils for lubricating purposes.

The naphthas from this process are treated with sulphuric acid, washed and neutralized with caustic soda and redistilled for separation into the various grades of gasoline. From Pennsylvanian petroleum 88° Baumé gasoline is separated for use in carburetting air in gas machines to be used both for domestic heating and lighting. Following this is cut a grade known as 76° Baumé gasoline and then follow the heavier grades used as fuel for automobiles and other internal combustion engines. Because of the great demand for the latter purposes very small amounts of the higher grades are now separated. This demand has also resulted in a multiplication of "cracking processes," so that stills or other devices in which some of the high-boiling residuals may be cracked and recombined under pressure are now being erected in large numbers.

Burton Process.—One of them is the Burton process which has been developed commercially to such an extent that the production

of "motor spirits" by this method alone was stated in April 1916 to amount to over 3,000,000 barrels per year. The apparatus used by Burton consists of a still mounted over a furnace and equipped with a safety-valve, pressure gauge and thermometer. A pipe leads from the top of the still to the usual condenser, consisting of a pipe-coil immersed in the usual cooling tank. From near the lower end of this coil, a small pipe leads up to a relief valve, and lower, connected to a receiver for the condensates, is a shut-off valve. This valve is normally closed. The relief valve allows any excess gas pressure to escape. The pressure with the shut-off valve closed runs up to four or five atmospheres, raising the boiling point from 500° F. to 750° F. or 800° F. After charging a Burton still with the special cut of distillate oil that has been found to yield the most satisfactory products, the fires are started and distillation begins. Similarly to the way steam pressure is built up by the evaporation or distillation of water in a steam boiler, so the oil vapors build up the pressure in the still, condenser and receiver, oil and vapor—two phase system—being under the same pressure. The heavier distillates are "cracked" under this treatment and recombined to form good yields of gasoline, the residual being purified and utilized as a lubricant. The shut-off valve is opened at intervals to allow withdrawal of the gasoline formed. As stated, in this process both vapor and liquid are subjected to the same pressure, differing in this respect from the Rittman process in which the vapor only—one phase system—is under pressure. Another difference is that the Burton process is operated chiefly for the production of gasoline, while the Rittman process can be operated either to produce gasoline or the aromatic hydrocarbons, benzol, toluol and xylol.

Rittman Process.—In the process of Walter F. Rittman, vaporized petroleum is passed into a hot tube at 840° F., the pressure in the tube being held variously from 90 to 500 pounds per square inch, adjusted for the product desired. The cracked vapors are condensed under pressure and the condensate transferred to a still where it is distilled for its gasoline content. It is claimed for this process that by cracking the oil in the form of vapor any combination of temperature and pressure may be applied; and any oil from kerosene to much heavier fractions may be used. It is interesting that Rittman concludes as the result of experiments that the formation of aromatic hydrocarbons (benzol, toluol, etc.) occurs best at moderate to high temperatures and under high pressure. The formation of gasoline is favored by moderate to low temperatures and by high pressure.

McAfee Process.—For the increased production of gasoline, this is an interesting method depending on the reactive or catalyzing power of aluminum chloride and proper temperature control. There is no need of employing extra pressure, or vacuum or special apparatus; any still with a stirrer in it suffices. The operation is so controlled that the vapor is kept at a temperature not to exceed 356° F. The distillate obtained will be a mixture of gasoline, solvent oil and kerosene which is afterward separated by fractional distillation. These products are all water-white, sweet-smelling, saturated and

need no refining with sulphuric acid. In practice no treatment is given them except a washing with alkali followed with water to remove hydrogen sulphide. With proper back-trapping of high-boiling oils into the still from the air-cooled condenser of 320° F. in the vapor line, the distillate obtained will be gasoline alone which is ready for the market when washed with an alkaline solution.

Fractional Distillation.—The other method of distilling crude petroleum is by fractional distillation throughout the process and with the least possible cracking or decomposition. Stills for this purpose are horizontal cylindrical tanks from approximately 30 to 40 feet in length by 10 to 12 feet in diameter, some of them holding as much as 1,000 barrels. These stills are mounted similarly to those for destructive distillation except that the tops are bricked over and insulated, with even greater care than with steam boilers, to prevent any possible condensation within the still. They are also supplied internally with perforated iron pipes at the bottom to allow the admission of steam to keep the oil in agitation during distillation, as well as to assist in carrying over the oil vapors as fast as formed. These stills are fitted with vapor pipes, condensers, look-boxes, etc., much the same as the stills for destructive distillation above described.

During the early part of the process the naphthas and burning oils come off practically the same as in the cracking process. Below the fraction from which the kerosene can be made is a heavier distillate utilized in making a burning oil of 300° F., fire test, which is used in signal oils required for lighting on steamboats or other means of transporting passengers where electricity is not available. Then follow heavier distillates containing the paraffin wax. The residual is a heavy viscous oil which may be used just as produced for the lubrication of the cylinders of steam engines or may be first filtered through filtering clay to decolorize it and brought on the market as a transparent oil. From this filtered cylinder stock petrolatum is also manufactured.

The wax distillate is chilled and pressed for the removal of the paraffin wax. The wax is submitted to various operations, being washed with sulphuric acid to decolorize and sweeten it by dissolving out unsaturated bodies that bear both color and odor; by being neutralized with a soda solution which also dissolves out bodies not removed by the acid, by being washed with water to remove all traces of chemical treatment; and finally filtered and put on the market as refined wax of different melting points. One grade has become an important article of domestic consumption because of its adaptability as a "cover" for jelly jars. The wax is chemically pure and heating for the purpose of melting so sterilizes it that jelly covered with the melted wax always "keeps." The wax-free distillate is fractionated by further distillation into various grades which are given the added preparation needed for each special service and the whole series from this process brought to the market as "neutral oils." While all petroleum is practically neutral in reaction, the term "neutral oil" has always been applied to the lighter colored distillate oils made by the process of "fractional distillation."

One of the most notable variations of the

process of fractional distillation is the use of diminished pressure by means of which the distillation proceeds at lower temperatures and reduces possible cracking to the minimum. The inventor of the vacuum process, patented in 1866, expected to convert the entire body of the crude petroleum into illuminating oil, the hope of all refiners at that period. However, though the results obtained in working this patent were disappointing, they did furnish products of such excellence that they became the foundation of what has grown to be the largest industry of its kind in the world. They were the first unburned residual oils offered for sale and were sold direct to consumers, a policy always followed. The Gargoyle Brands, or, as they were earlier known, the Vacuum Brands, of lubricating oils, have literally carried the name of the Vacuum Oil Company of Rochester, N. Y., around the world.

Wells Process.—Another modification for fractional distillation was patented by Willet C. and Frank E. Wells, in 1908. The essential apparatus consists of a separating vessel to contain the petroleum to be refined and fractionated; a condenser in which to cool the distilled fractions; receiving tanks for holding the condensates; a pump for circulating gas, and a steam boiler for generating steam with which to heat the petroleum, there being no furnace under the separating vessel. The heating coil in the latter has an upper and a lower connection with the steam boiler, both above the water level to ensure circulation. Instead of the usual blowing of steam into the petroleum to assist in the distillation, the Wells process is based on the theory that a permanent gas pre-heated to a definite temperature injected into the petroleum heated to a corresponding temperature will absorb fractions having boiling points corresponding to these temperatures. By raising the temperature of the petroleum as well as the gas all of the desired fractions can be successively distilled, leaving the heavy residual in the separating vessel. The gas laden with the distillates from the petroleum is conducted through the condenser and thence to the receiving tanks. Here the separation is completed, the condensed fraction remaining in the tank, the gas being exhausted by means of the pump and returned to the separating vessel through heated pipes, to again perform its function of extracting fractions of consecutively higher boiling points. If it be desirable to decolorize any fraction, this is done by passing it, while still dissolved in the gas, through filters charged with fullers earth.

In no other country has the manufacture of lubricating oils reached such a high degree of excellence as in the United States. No other crude affords such a wide range of lubricating oils as the paraffin base oil from the Appalachian field. These facts are substantiated by the practically exclusive use in this country of mineral lubricating oils of domestic manufacture for all purposes, and by the greater and constantly increasing quantities exported.

Export.—For many years the production of crude oil was in excess of the home demand and over one-half of the entire yield had been compelled to seek a market in foreign lands. This condition has changed considerably as shown by the figures available for 1915. During that year there was produced in the United

States 11,806,372,368 gallons of crude petroleum of which only 158,263,069 gallons were exported. Prior to the development of the Russian oil industry on the Caspian Sea, on a large scale, American refined oil held almost undisputed sway in the markets of the world. Latterly the Java petroleum has become an active competitor.

Nearly all the oil shipped abroad is transported in bulk in tank steamers specially constructed for the purpose. Beginning about 1900 large fleets of these vessels have come into existence, and the ocean carrying trade of oil in bulk has assumed vast proportions. These vessels are built of steel and many of them use oil for fuel to furnish their steam power. The largest motor-driven ship built in America to date is equipped with three Bolinder internal combustion engines and is owned and used exclusively by the Vacuum Oil Company for the transportation of petroleum and its products. While sailing vessels are sometimes used for cargoes of lubricating oils in barrels, their employment for this purpose has nearly ceased. By the old method, the sailing vessel carrying from 5,000 to 8,000 barrels of oil would make but three or four trips a year. The modern type of tank steamer has been increasing in size from the 6,000 to 10,000 tons carrying capacity, capable of making 8 to 10 trips per year, to the tanker *Standard* which holds enough oil to fill 108,000 barrels of the customary 50-gallon size.

The first of the very large tankers for export shipments was the *Narragansett*, completed for the Anglo-American Oil Company in 1903. She is built of steel, and has a gross tonnage of 9,169 tons.

The oil tanks proper, of which there are eight, are situated four forward and four aft of the machinery space and are divided by a longitudinal bulkhead running fore and aft through all the tanks.

The steamship *Paulsboro*, completed for the Vacuum Oil Company in September 1916, is a typical vessel of the modern tanker type; built of steel—435 feet long, 56 feet beam, depth of 33 feet 6 inches. She has a capacity for 11,529 tons of cargo, the equivalent of 78,835 42-gallon barrels. Besides this, she has a capacity for fuel oil, for the use of her boilers, of 1,708 barrels. She has 8 main oil tanks besides 10 wing or summer tanks and 2 fuel tanks. She is propelled by triple expansion engines and has a speed of 12½ knots under fully loaded condition in good weather. She is equipped with two National Transit cargo pumps size 18" x 14" x 24". Pipe-lines are 12-inch.

The record of petroleum and its products exported since 1862, together with its value, is as follows, as reported by the United States Bureau of Statistics:

PETROLEUM EXPORTS AND VALUE FOR YEARS 1862 to 1916.

YEAR	Gallons	Value

As stated, the manufacture of lubricating oil in the United States has reached a high degree of perfection. The recognition of this fact abroad is attested by the record of our exports

of lubricating (heavy paraffin, etc.) oils with their values since 1889 given below:

YEAR	Gallons	Value
1889.....	27,903,267	\$4,638,724
1890.....	32,090,537	4,766,850
1891.....	33,310,264	4,099,978
1892.....	34,026,855	5,130,643

Petroleum as Fuel.—With the largely increased supply of crude oil in 1913, its use as a fuel oil was considerably extended, particularly in the West and Southwest section of this country where the difficulty of obtaining coal as fuel has been greatest. Both locomotives and steamboats have been fitted for burning fuel oil. This is in some cases the crude itself, in others the residual after taking off the kerosene and lighter products—and in still others, the distillates too light for lubrication and too heavy for illuminating oils. The American merchant ships especially in the Pacific, depend almost entirely on petroleum as a fuel, and its popularity in the Atlantic coastwise trade is making its use general there. However, in the States near the great bituminous coal mines where the solid fuel is obtained at relatively lower prices, oil is more expensive to burn for the generation of steam power than coal, though there are many uses to which the liquid fuel is adapted where it would not be possible to use coal. One-half the tonnage of the ocean-going steamers now being built in America are constructed with tanks for oil for fuel, an indication of the line of future development of American trade.

Some figures were published early in 1917 as to the needs of the United States navy for fuel oil, including 1923. For 1917 it was expected that 1,475,000 barrels would be required and this quantity necessarily increased from year to year, so that in 1923 the volume to be provided would amount to 6,721,000 barrels. To take care of this supply the government has set aside certain claims in the West; some of it is proven territory which, it is believed, will take care of the needs of the navy. One of these fields is known as Reserve No. 2 and probably contains above 400,000,000 barrels of oil.

Complete statistics of the consumption of petroleum as fuel in the United States are not available. Data compiled from reports by pipeline companies show 48,868,000 barrels of do-

mestic crude petroleum were delivered for fuel purposes in 1915. In addition more than 16,000,000 barrels of crude oil, much of which was used as fuel, were imported from Mexico; and indeterminate quantities of refinery products of domestic oil found the same use. In the oil fields of the United States, no less than 3,191,000 barrels of crude oil, not recorded anywhere, were consumed in drilling and pumping.

During 1916, 85 railroads, operating in 21 States and Territories, used fuel oil in whole or in part. The following table shows consumption for several years:

STATISTICS OF OIL-BURNING RAILROADS.

YEAR	Fuel oil consumed, barrels	Length of line operated by use of fuel oil, miles	Total mileage made by oil-burning engines, miles	Average No. miles per bbl. oil consumed, miles
1906	15,577,655			
1907	18,849,803	13,573	74,079,726	3.93
1908	16,870,882	15,474	64,279,509	3.81
1909	19,905,335	17,676	72,918,118	3.66
1910	23,817,346	22,709	89,107,883	3.74
1911	29,748,845	30,039	109,680,976	3.69
1912	33,605,598	28,451	121,393,228	3.61
1913	33,004,815	29,145	118,672,162	3.60
1914	31,093,266	29,595	118,737,469	3.82
1915	36,648,466	30,776	125,255,525	3.39
1916	42,126,417	31,980	140,434,566	3.33

The following table shows the relative evaporative values of various coals in comparison with petroleum. In addition, however, the labor item enters in deciding which is the more economical steam producer for the individual plant.

ONE POUND OF COMBUSTIBLE	Pounds of water evaporated at 212° F. per pound of combustible	Barrels of petroleum required to do the same amount of evaporation as tons of coal	Cost of coal per ton to equal petroleum at \$1 per barrel	Less 10 per cent, owing to the greater economy in handling petroleum
Petroleum, 18° to 40°	16.0	...	...	...
Pittsburgh lump and nut, Pennsylvania	10.3	4.1	\$4.10	\$3.69
Pittsburgh nut and slack, Pennsylvania	8.0	3.2	3.20	2.88
Anthracite, Pennsylvania	9.8	3.9	3.90	3.51
Indiana block	9.5	3.8	3.80	3.42
Georges Creek lump, Maryland	10.0	4.0	4.00	3.60
New River, West Virginia	9.7	3.8	3.80	3.42
Pocahontas lump, Virginia	10.5	4.2	4.20	3.78
Cardiff lump, Wales	10.0	4.0	4.00	3.60
Cape Breton, Canada	9.2	3.7	3.70	3.33
Nanaimo, British Columbia	7.3	2.9	2.90	2.61
Co-operative, British Columbia	8.9	3.6	3.60	3.24
Greta, Washington	7.6	3.0	3.00	2.70
Carbon Hill, Washington	7.6	3.0	3.00	2.70

One pound petroleum = 16 pounds of water evaporated from and at 212° F.

One pound coal = 10 pounds of water evaporated from and at 212° F.

One pound petroleum = 1.6 pounds good coal.

(2,000) = 1,250 pounds petroleum = 2,000 pounds coal.

16 312 pounds petroleum = 1 barrel of petroleum.

(1,250) = 4 barrels petroleum = 2,000 pounds coal.

312

As these figures are based on equivalent weights, it follows that the fuel oils of low degree Baumé or high specific gravity offer advantages both as to heat units per barrel and as to storage capacity required.

FLORUS R. BAXTER,

Chief Chemist, Vacuum Oil Company.

PETROLEUM POISONING. Not a few instances of poisoning by petroleum have been recorded in medical annals, and numerous experiments have been performed upon animals

in the endeavor to determine the character of its effects. These experiments have seemed to prove that the deleterious effects noted have been caused only by the heavy oils and the residuum after distillation, the light oils being entirely harmless. The chief symptoms recorded were an irritation and inflammation of the stomach with a few lacerations and blood clots on the lining membrane of the stomach and intestines in extreme cases. On the other hand the widespread use of refined heavy oil by multitudes of persons for the relief of sluggish action of the bowels indicates that except in large quantities the poisoning effects do not supervene. In excessive doses petroleum has been known to cause faintness with vertigo, headache and palpitation of the heart.

PETROLIA, Canada, town of Lambton County, Ontario, on the Michigan Central and the Grand Trunk railroads, 20 miles southeast of Port Huron. It is an important oil-producing centre, has numerous oil wells, refineries, etc., and manufactures of oil-well machinery, boilers, automobiles, wagons, machine-shop products, bricks, etc. It has also a hospital, public library, two parks and a business college. Pop. 3,518.

PETROLOGY, that branch of geology that treats of the origin, composition, texture, classification and occurrence of rocks. Petrography is narrower, dealing only with composition, texture and classification, largely as revealed by the petrographic microscope. Lithology has been used as a synonym for petrology, but is coming to be applied to a study of rocks without the microscope, but otherwise in the more

restricted sense of petrography. See OPTICAL MINERALOGY; ROCKS AND GEOLOGY.

PETRONIUS, pe-trō'nī-ūs, *Arbiter*, Roman author, identified as the man of unsavory reputation, known to be the favorite of Nero, at whose court he was *arbiter elegantiarum*. The influence thus gained by Petronius made him an object of dislike to the all-powerful Tigellinus. Accused of treason, he forestalled what he thought inevitable death by an eccentric suicide, opening his veins, but prolonging

life for some time by the application of bandages (66 A.D.). Such is a brief résumé of the account by Tacitus in the 'Annales.' To this Petronius is generally assigned the book known as 'Satira' or 'Satiricon,' an incomplete work of picaresque fiction in prose and verse, published in Paris in 1601 and in Amsterdam in 1663. The longest portion is the 'Banquet of Trimalchio' ('Cena Trimalchionis'), a satirical account of a dinner given by Trimalchio, a good-humored freedman and *nouveau riche*. The work is of interest from the fact that in the speech of many of the characters is preserved the *sermo plebeius*, or dialect of the lower classes, of which little remains. The best text is that of Bücheler (1862; smaller ed., 1895). There is an edition of the 'Cena,' with commentary, by Waters (1901); and an English translation of it, with introduction by Harry Thurston Peck (New York 1898). Consult also Collignon, A., 'Etude sur Petrone' (Paris 1892); Whibley, C., 'Studies in Frankness' (New York 1912).

PETROPOLIS, păt-rô'pô-lēs, Brazil, city of the state of Rio de Janeiro, 30 miles by rail from the city of that name. Virtually a health resort, it lies in the Serra d'Estrella, was built in 1845 and settled by a German colony who named it in honor of Dom Pedro. It is a thriving and picturesque mountain city, with broad, clean streets, down some of which run little brooks. The buildings are of tasteful architecture, and hotels and sanitariums abound. The city is connected with Rio de Janeiro by two railway lines, and it is the favorite summer resort for the government officials and diplomats of the capital and for the élite of the entire country. Several attempts have been made to have Petropolis declared the capital of its state, but that distinction is firmly held by its commercial rival, Niteroy, on the coast. The city has varied manufactures and a population estimated at about 12,000.

PETROTOME. The petrotome is a machine for cutting sections of rocks or fossils and is used both by mineralogists and biologists. Its essential feature is a circular saw of some rather soft metal, like tin, without any teeth, but with the edge impregnated with diamond dust. The saw is run at such a tremendous speed that the centrifugal force keeps it rigid. A stream of cold water keeps the saw and the object from becoming too hot. In botany, it is used for cutting sections of petrified plants. Many fossils are mere impressions, or "casts," which show only the form without internal structure; but some, designated as petrifications, show both external form and internal structure. The method of cutting thin sections of petrifications is the same as for cutting granite or any other hard rock.

Let us suppose that a transverse section of a petrified stem a couple of inches in diameter is to be cut. First the stem is fastened in a rigid clamp and a piece is sawed off so as to leave a fairly smooth surface. This surface is then polished by holding it on a revolving disc covered with polishing powder and water. The polished surface is now cemented to a glass slide. Dry white shellac, heated until it melts, is a good cement. The polished surface is pressed firmly into the cement. When it has become cool the object is again fastened in the

clamp and sawed off as close as possible to the glass slide. The section firmly cemented to the slide is now ground thinner and polished on the revolving disc until it is thin enough for microscopic observation. Any powder and dirt is carefully washed away. When the slide is perfectly dry a few drops of Canada balsam and a thin cover glass are added, and the mount is ready for use. Not only cell walls, but even the nuclei and other cell contents are easily shown in sections cut from Paleozoic rocks. Consult Chamberlain, C. J., 'Methods in Plant Histology'; Wieland, G. R., 'American Fossil Cycads' (Vol. I).

CHARLES J. CHAMBERLAIN.

PETRUCCI, pā-troo'chē, Ottaviano dè ('PETRUTIUS FOROSEMPRONENSIS'), Italian printer: b. Fossombrone, near Urbino, Italy, 1466; d. 1539. He invented the art of printing music by means of movable types, each note being cast complete with a staff line. He established himself in Venice in 1491, and in 1498 was granted sole right to the use of his discovery for 20 years by the council of Venice. From 1498-1511 he prospered, but then attempted further experiments which proved so expensive that he was forced to sell his rights. He then removed to his native city, and from Pope Leo X secured rights for the papal states for 15 years, but never achieved any considerable success there. His process involved double printing, the staff lines being first laid on and then the notes in their proper position requiring the utmost nicety in execution. The specimens remaining of his work are exceedingly neat and exact and are both rare and valuable. His first work was 'Harmonice Musices Odhecaton A.' It was printed in Venice in 1501. It comprised a collection of 96 pieces arranged for three or four voices by eminent musicians of the time. He was very prolific, his publications following one another in rapid succession. A fine collection of his works is treasured at the British Museum.

PETRUCHIO, pē-troo'chō or -ki-ō, in Shakespeare's 'Taming of the Shrew,' a gentleman of Verona, who becomes the husband of Katherine, Baptista's high-tempered daughter, known to her friends and neighbors as "the shrew." Petruchio treats her with a mad turbulence even exceeding hers, in order "to kill her in her own humor." Under all his roughness he preserves his own good nature, and in the end the "taming" of Katherine is complete.

PETTENKOFER, pēt'ten-kō-fēr, Max Joseph von, German chemist: b. near Neuburg, 3 Dec. 1818; d. 10 Feb. 1901. He was graduated from the University of Munich with the degree of M.D. in 1843. Following his graduation he was associated with Liëbig in his preparation of meat extracts. In 1847 became professor of chemistry there, a post which he held until 1894. He was the earliest in Germany to give practical instruction in hygiene, which he began to do in 1866, and his name has since been associated with advances in that direction. He made many valuable contributions to science on subjects as various as gold-refining, gas-making, the manufacture of glass, ventilation, clothing, the influence of soils on health, epidemics,—his researches in regard to ventilation and cholera being of especial value. He also established the

connection of the rise and fall of subsoil water with the prevalence of typhoid. He was the first to demonstrate that cholera is propagated by a germ and that local conditions are largely responsible for the spread of the disease. He published 'Untersuchungen über die Verbreitungsart der Cholera' (1885); 'Ueber den Luftwechsel in Wohngebäuden' (1858); 'Populäre Vorträge'; 'Beziehungen der Luft zu Kleidung, Wohnung und Boden'; 'Handbuch der Hygiene' (1882), etc.

PETTIE, pět'i, John, Scottish genre painter: b. Edinburgh, 17 March 1839; d. Hastings, 21 Feb. 1893. He exhibited for the first time in the Royal Scottish Academy 'The Prison Pet' (1859); removed to London in 1862 and was elected associate to the Royal Academy in 1867 and Royal Academician 1875. His work as a historical painter was much admired and his pictures sold well. Of the very large number which he produced only a few of the more prominent ones may be mentioned, 'Disgrace of Wolsey' (1869); 'Juliet and Friar Laurence' (1874); 'Flag of Truce' (1873); 'Duke of Monmouth before James II' (1882), etc.

PETTIGREW, pět'i-groo, James Johnston, American soldier: b. Tyrrell County, N. C., 4 July 1828; d. Bunker Hill, Va., 17 July 1863. He was graduated from the University of North Carolina in 1847, was professor in the Naval Observatory at Washington for a year when he resigned to study law in Charleston, S. C. He was admitted to the bar in 1849. Early in 1850 he went to Germany where he spent about two years in the study of law, and afterward traveled extensively. For a few months he acted as secretary of legation at Madrid, returning in 1852 to Charleston where he practised law with much success. In 1856 he was elected to the legislature, where he vigorously opposed the slave trade. Foreseeing the Civil War he went in 1859 to Italy in order to acquire knowledge of arms in the Sardinian army, but they had been withdrawn from active service. He then returned to South Carolina and engaged in drilling a regiment of riflemen. With this regiment he took possession of Castle Pinkney in December 1860, immediately upon the secession of his State. After the opening of the Civil War he proved himself an able engineer in the construction of batteries and was appointed brigadier-general in the Confederate army in 1862. He defended Richmond against General Stoneman in 1863 and at the battle of Gettysburg led his brigade in Hill's corps against the Iron brigade. He was in command of Heth's division on the third day and participated in the famous charge on Cemetery Ridge. In the retreat which followed the battle he was fatally wounded. His book, 'Spain and the Spaniards,' was published in 1861.

PETTIGREW, Richard Franklin, American lawyer and political leader: b. Ludlow, Vt., 23 July 1848. He was educated at Beloit College, Wisconsin, and at the law school of the University of Wisconsin. In 1869 he went to Dakota as surveyor in the United States service, and located at Sioux Falls, where he engaged in surveying and real estate business. It was not until 1872 that the population of that section had increased to the degree that he could enter upon the practice of law. He became prominent also in public life; was a mem-

ber of the legislative council of Dakota 1877-81; represented the Territory in Congress in 1881-83; was a member of the Constitutional Convention in 1883, and of the Territorial Council in 1884-85. After the admission of South Dakota as a State he was elected to the United States Senate on the Republican ticket, where he served two terms, from 1889 to 1901. In 1896 he left the Republican party on account of its opposition to the free coinage of silver and its attitude toward the trusts, and in the elections of that year and of 1900 supported Bryan for the Presidency. After the Spanish War he led the opposition in the Senate against the annexation of the Philippines and the imperialistic policy. Besides his political activities he took a leading part in civic and industrial enterprises, building the Sioux Falls street railways and the Sioux Falls Terminal Railway, and organizing the Sioux Falls Stock Yards and the Midland Pacific Railroad, extending from Sioux Falls through Wyoming and Idaho to Puget Sound.

PETTUS, Edmund Winston, American legislator: b. Limestone County, Ala., 6 July 1821; d. Selma, Ala., 27 July 1907. Pettus was educated at Clinton College, Tennessee. In 1842 he was admitted to the bar and began the practice of law at Gainesville, Ala. From 1842 to 1855, except for a short time when in California, Pettus was district solicitor. From 1855-58 he was circuit judge. In the Mexican War he served as a lieutenant. When Alabama seceded in 1861 Pettus was sent as commissioner to Mississippi, of which State his brother was governor. He entered the Confederate army as major and rose to be brigadier-general in the Western army. After the war he devoted himself to his profession until 1897 when he was elected to the United States Senate. He was re-elected in 1903 without opposition.

PETTY, pět'i, Sir William, English political economist: b. Romsey, Hampshire, 26 May 1623; d. London, 16 Dec. 1687. He showed great precocity in carpentry and other mechanical trades, and went to sea in his early teens. Suffering a broken leg on ship board he was left by the sailors on a sparsely settled section of the coast of France, where he devoted himself to teaching until he had acquired funds to enter the Jesuit College at Caën. He later studied at the universities of Utrecht and Amsterdam and then took a course in medicine at Leyden and at Paris. Returning to England he entered the Royal navy, but during the Civil War lived on the Continent. In 1648 he was instructor in anatomy and chemistry at Oxford; in 1651 filled the chair of anatomy there, at the same time holding a professorship in music at Gresham College, London, and in 1652 he was appointed physician to the army in Ireland, a post in which he achieved renown in his skilful reorganization of the medical service. He was secretary to Henry Cromwell when the latter was lord-lieutenant of Ireland but upon the Restoration soon gained the confidence of Charles II, who appointed him surveyor-general of Ireland and knighted him. He was thus the founder of the Lansdowne family. He was a founder of the Royal Society and one of the leading political economists of the day, receiving the title of "The Father of English Economics." He published 'Political Anat-

omy of Ireland' (1672); 'Observations upon the Cities of London and Rome' (1687); 'Political Arithmetic' (London 1683-89). His 'Economic and Statistical Writings' were gathered and published by Charles H. Hull in 1894; and another edition by the University Press, Cambridge, England, in two volumes in 1899. His history of the survey of Ireland, 'The Down Survey,' was published by the Irish Archaeological Society in 1851, at Dublin. Consult Bevan, W. L., 'Sir William Petty' (Baltimore 1894); Carroll, W. G., 'The Lansdowne Irish Estate and Sir William Petty' (Dublin 1881); Fitzmaurice, E. C. P., 'Life of Sir William Petty' (London 1895).

PETTY OFFICER, a rank among the enlisted men of the navy analogous to the non-commissioned officers of the army. Such officers are comparatively more numerous in the navy and receive a higher rate of pay than the army non-commissioned officers. They are also eligible to promotion to warrant rank, and under certain conditions are commissioned as ensigns.

PETTY SESSIONS, Court of. See COURT.

PETUNIA, pĕ'tū-nĭ-ā, one of the most popular of garden flowers on account of its profusion of bloom under almost all conditions of soil and culture. A defect in the habit of the plant is its tendency to sag down on the ground after reaching a modest height, and sprawl about, with, however, many upright flowering branches. This feature is not objectionable where the plants are massed, and in the dwarf varieties, like the little Countess of Ellesmere group, is practically absent. In other uses the plants may be potted and trained to stakes, the pots being sunk in the ground.

From the 16 known natural species the florists have, through hybridizing, obtained remarkably beautiful and rich shades of crimson and rose in which lingers hardly a trace of the objectionable magenta of earlier days. There are also to be found among them magnificent shades of purple, and one group is decorated with a distinct yellow throat. A profusion of blotched, striped, penciled and spotted varieties have been produced, and these are peculiarly effective when massed, as well as interesting individually. Another section has its ample corollas deeply ruffled and fringed, as well as variegated. The *grandiflora* or large-flowered type bears great ruffled flowers five inches or more across, the throats often veined and stained with a characteristic blackish purple. Double varieties, produced in the first instance as sports, have been multiplied by fertilizing the single and semi-double flowers with the pollen of the best doubles. The seed thus obtained will produce from 25 to 40 per cent of fine double-flowering plants, and the remainder of the seedlings are apt to be the choicest of the single blooms. Double petunias of fine form and habit are propagated by cuttings, and thus an endless succession of the best types preserved.

Petunias thrive best in deep rich soil and abundance of sunshine. In the open ground they bloom continuously from June to September. For early flowering the seeds are sown in a hotbed and transplanted into the borders when the weather has become settled warm.

They are quite tender and are stunted by low temperatures. The seeds may be sown directly in the open border when the ground has become warm. For winter blooming in pots it is customary to strike cuttings from the bedded plants in early September and bring them along under glass protection.

The wild species are mostly natives of Brazil, Argentina and southern South America, although one is Mexican and one, *P. parviflora*, has become naturalized in the southern States. They are perennial herbs belonging to the order *Solanaceæ*, with opposite leaves and axillary blossoms. The species which have been most used in the production of the modern garden petunias are *P. violacea*, which is probably not now in cultivation as a pure species, and *P. nyctaginaliflora*, which may be found in some old gardens. The former has purplish-violet blossoms; the latter, white.

PETZITE, a telluride of silver and gold (AgAu)₂Te. Carrying from 18 to 25.6 per cent of gold and 40.7 to 46.8 per cent of silver. An important ore in San Juan and other districts, Colorado, and in several mines in California.

PEUERBACH (PURBACH or PEURBACH), Georg von, Austrian astronomer and mathematician; b. Peurbach, 30 May 1423; d. 8 April 1461. He studied at Vienna and delivered astronomical lectures in the principal cities throughout Europe, later becoming professor of astronomy at the University of Vienna. He prepared a table of sines, which probably were the basis for the modern decimal fraction, but he died before it was done, and his pupil, Regiomontanus, completed it. He was also astronomer to the king of Hungary, and prepared for him a list of planets and the fixed stars. His chief works, published after his death, were 'Theoricæ novæ Planetarum' (1472); 'Tabulæ Eclipsium' (1514).

PEUTINGER'S (poŭ'ting-ĕrz) **TABLE** (*Tabula Peutingeriana*), a popular name for a Roman chart showing the military roads of the world, drawn, it was formerly believed, for Theodosius the Great in the 3d century. In the original it was in 12 sheets. It is so called after Conrad Peutinger, a German scholar (1465-1547). Among his papers was this famous map, evidently a copy by a monk at Colmar in 1265. Conrad Celtes, who found it in the Benedictine monastery of Tegernsee, borrowed and did not return it. Such a *mappa mundi in rotulo* was extant in that convent in 1502. Celtes bequeathed this map to Peutinger, who intended to publish it, but his death intervened. After his death it disappeared for many years, until Mark Welser published fragments of it. The manuscript of the map is at present in the imperial library at Vienna, where an additional leaf of it was some time ago discovered. The characters and figures show that the map is not the original. Docen thinks that it belongs to the 12th century. Impressions have been published by Mannert (Leipzig 1824), Desjardins (Paris 1869-70) and Miller (Ravensburg 1888), the last on a reduced scale.

PEVERIL OF THE PEAK, a novel by Sir Walter Scott, published in 1823. The time of the story is the reign of Charles II, and the action takes place in the Peak region of Derbyshire and on the Isle of Man. The story

is built around Sir Geoffrey Peveril, of the Peak, as the principal character.

PEWEE, a popular name given to several species of American flycatchers of the subfamily *Tyranninae*, the typical Tyrant-birds or king-birds. The common pewee or Phoebe-bird (*Sayornis fuscus*), is seven inches long and nine and one-half inches in wingspread. The general color is dull olive brown above, darkest on the head and yellowish white below with a brownish hue on the breast; quills brown, most of the wing feathers edged with dull white; tail forked, the outer edge of the lateral feather dull white; bill and feet black. This lively species is found throughout eastern North America, from Newfoundland to Florida, and as far west as eastern Wyoming and Colorado. The pewees winter generally in the Southern States, but some go to Mexico, Central America and the West Indies. In the Middle States it arrives from the south early in April and gets out a first brood by the middle of May; it leaves again for the south in October, migrating by night. Though the pewees mate for life they do not migrate together, the one first returning waiting near the old nest till its mate arrives. The nest resembles that of the barn swallow, being made of mud, grasses and moss, lined with softer materials and attached to a rock, wall or rafter. The rough stone piers of a country-bridge are so often chosen that a widespread name for the bird is "bridge-pewee." The owners sometimes repair the same nest year after year; the eggs, four to six, are white, with a few reddish spots at the larger end; the young are hatched out on the 13th day, and leave the nest in 16 more; the parents show great affection for them, snapping the bill and darting boldly toward all intruders. The flight of this bird is rapid, with frequent sailings; it is fond of vibrating the tail, erecting the crest and making a tremulous motion with the wings. It feeds on insects, which it takes with great dexterity and rapidity on the wing, swallowing them whole, and, after digestion, ejecting the hard parts. The pewee though offish with human beings is fearless of them, and becomes in a measure sociable upon extended acquaintance.

The wood pewee (*Contopus virens*) is six and one-half inches long and 10¾ in extent of wings, the wings extending beyond the tip of the tail; the general color above is brownish olive; brownish black on the head; two pale grayish bands across the wings; a narrow white circle around the eyes; greenish yellow below, with a grayish tinge on the throat and breast. Its range is about the same as that of the phoebe-bird. It is fond of forests and shady orchards. The flight is swift, with sudden sweeps in pursuit of its insect prey. Its notes are low, mellow and sweetly melancholy when in its favorite haunts; its common name, like that of others of the sub-family, is derived from its utterance of the syllables "pe-wee" or often in three notes, as "pe-a-wee," plaintively prolonged. The nest of this flycatcher is a tiny cup of soft materials covered by lichens, and so apparently a part of the branch upon which it sits as to be seen with difficulty; the eggs are four or five, light yellowish, with reddish spots at the larger end;

in the Middle States two broods are raised in a season; it boldly attacks man, beast or bird approaching its nest.

Several other dark-colored flycatchers of this group are called "pewee" in various parts of the country, and most of them resemble the examples given above in general habits.

PEWS (Old French, *pui*, from Latin, *podium*, a balcony), enclosed stalls, or, also, open seats in a church devoted to the sole occupancy of a person or family. In the early part of the 14th century worshippers in churches were accustomed to stand or to sit on the floor. A little later they were provided with short three-legged stools. But from 1450 onward mention is found in church records of "pues." The title of "reading Pue" was given in those days to the elevated stall which held the reading desk. Pews were in use before the Reformation in England and are held by their occupants in the Established Church, by two tenures: first, by prescriptive right, when they descend as an heir-loom; second, all pews not so held are at the disposal of the bishop of the diocese for use and benefit of the parish, and are under him assigned by the church wardens to the parishioners according to their rank. The bishop may grant the right to sit in a particular pew. In the disposal of the pews or seats in the area of parish churches in Scotland parishioners have a preferable claim according to the valued amount of their rent. The disposal of pews or seats in churches of other denominations is a matter of private arrangement. They are commonly rented to defray the congregational expenses. In the United States pews are the property of the church corporation, who can sell or lease them. Whether property in pews is real or personal depends upon the provision made in the statutes of the different States. A purchaser or lessee of a pew may maintain an action at law for trespass or disturbance in the enjoyment of his right. The usual church practice under its rules is to reserve owned and leased pews only for a limited period after the commencement of a regular service. If they are not then occupied by the owner or lessee, they are at the disposal of the ushers for seating other attendants at the service.

PEWTER, a generic term for a variety of alloys, of which tin forms the predominating component. The ordinary pewter is tin alloyed with lead, in the proportion of four parts to one. Specimens of the old Roman pewter left in England at the time of the Roman occupation of that country show a variance in composition ranging from 99 per cent tin to 1 per cent lead, for the richest, to 46 per cent tin and 53 per cent lead, with a little copper. Generally, however, the proportions were either 71.5 per cent tin to 27.8 per cent lead or 78.2 per cent tin to 21.7 per cent lead.

Specimens of early English pewter show a composition of 112 parts tin to 26 parts copper, with no lead, for what is called "fine pewter." Another formula is 84 parts tin, 7 parts antimony and 4 parts copper. A lower quality has 56 parts tin, 8 parts lead, 6 parts copper and 2 parts zinc. The harder alloys were used for articles subject to the greatest strains in their use, as in bowls and dishes. For mugs and tankards a somewhat softer

alloy was prepared; that is one containing more lead in proportion to the tin.

As early as 1348 the guild of pewterers in Great Britain were allowed to make a set of rules by which all pewterers were governed, and these rules were enforced on the trade by law; the intent being to prevent a debasement of the metal by so large a proportion of lead as to render it liable to poison any acid food standing in it.

In the manufacture of pewter three processes were employed. The metal was cast, spun on a lathe, or hammered. Molds were generally of gun metal or brass, and on account of the large expense of making them were passed about from shop to shop, each paying a proportion for their use. The decline of pewter followed upon the cheap production of pottery and china ware on the one hand, and of the activity of the silversmiths on the other. The pewterers for a time imitated the designs of the silversmiths, but the metal was not suited to this work, and lost a large part of its artistic value in consequence.

A revival of interest in pewter had begun by several English societies just before the War broke out in Europe. There is so much of historical and artistic value in the old pewter that it offers a fair field for collectors, and with the return of peace a renewal of the pursuit is to be anticipated.

Bibliography.—Bell, Malcom, 'Old Pewter' (London 1906); Markham, C. A., 'Pewter Marks and Old Pewter Ware' (London 1909); Masse, R. J. L., 'Chats on Old Pewter' (London 1911); Moore, N. H., 'The Pewter Collector's Manual' (London 1907); Welch, C., 'History of the Worshipful Company of Pewterers of the City of London' (2 vols., London 1902); Wood, L. I., 'Scottish Pewter Ware and Pewterers' (Edinburgh 1904).

PEWTER-MUGGERS, in American history, a popular name given to a New York faction of the Democratic party which was opposed to the Tammany candidates in 1828. Their meetings being held in a Frankfort Street resort, where liquors were served in pewter-mugs the name was affixed by their opponents.

PEYER'S (pī'ērz) **PATCHES** or **GLANDS** (also called Peyerian Glands), in anatomy, aggregate oval patches on the surface of the mucous membrane lining the bowels, and surrounded by simple follicles, with flattened villi occupying the interspace. They are situated near the lower end of the small intestine (ileum), and their ulceration is the pathognomonic characteristic of enteric or typhoid fever. In health they are indistinct, groups about four inches in length and half an inch across. They were discovered and described in 1677, by Johann Konrad Peyer, a Swiss anatomist.

PEYOTE, pā-yō'tā, a small cactus (*Lophophora williamsii*) abundant in the southwestern United States and northern Mexico, formerly used by all the native redmen of that region as an exhilarant in connection with certain ceremonies, and as a remedy for various ailments; and is still so used among the remaining Indians and Mexicans. The effect is to produce a delightful and apparently non-injurious languor accompanied by a stimulated imagination. Some tribes look upon the plant as of divine origin and treat it with veneration. The name is de-

rived from the Aztec word *peyotl*, and was originally applied to a composite plant of southern Mexico.

PEYTON, pā'tōn, **Jesse Enlows**, American patriot and promoter: b. Maysville, Ky., 10 Nov. 1815; d. Haddonfield, N. J., 28 April 1897. He first came into prominence in 1843-44 through his secret and successful effort to raise \$40,000 to relieve Henry Clay from the seizure of his estate by creditors. He was one of the founders of the Constitutional Union Party in 1860 and was sent by President Lincoln on a mission to Kentucky to dissuade that State from seceding. The first regiment in the Civil War to reach Washington was a cavalry force that Mr. Peyton had raised in New Jersey, and of which he was quartermaster. He also organized two other regiments for the Union army, the 3d and 11th Pennsylvania cavalry. He was instrumental in promoting the centennial of Independence Day (Philadelphia 1876); Bunker Hill Day (1875); Yorktown Day (1881); and of the inauguration of American constitutional government. He was also the prime mover in the World's Columbian Exposition, held at Chicago, Ill., in 1893. At the time of his death he was attempting to organize an international celebration of the birth of Christ, to be held in Jerusalem in 1900. He was the author of 'Reminiscences of Philadelphia during the Past Half Century' (Philadelphia 1888).

PEZET, pā'thāt', **Federico Alfonso**, Peruvian diplomat: b. London, 1859. He received his education in England and at the Lima Military Academy; entered the army, and saw service in the war with Chile, in which he was taken prisoner. In 1884-86 Pezet was Spanish editor of the *Panama Star and Herald*, and in the latter year entered the diplomatic service of his country, becoming consul at Panama. Subsequently he served as consul successively at Liverpool, London and New York. In 1902-09 he was chargé d'affaires and consul general at Panama, was Minister to Panama in 1909, and in 1909-12 was envoy extraordinary to Central America and Panama. Pezet was appointed Peruvian Minister to the United States in 1912. He has published 'Peru: Its Commerce and Resources' (1893); 'The Question of the Pacific' (1901); 'What the Panama Canal Means to Peru' (1911); 'Handbook of Peru for Investors and Immigrants.'

PFÄFERS, pfä'fērs, or **PFEFFERS**, pfēf'fērs, Switzerland, a small health-resort in the canton of Saint Gall and 31 miles east of the village of that name. It is famous for its warm baths, situated in the vale of the Tamina, in one of the most extraordinary gorges in Switzerland. Its permanent population is about 600. The baths are built on a narrow ledge of rock a few feet above a rushing mountain torrent, the buildings which form them consisting of two structures connected by a chapel so deeply sunk between the rocks that the sun in the longest summer day is visible above them only from 10 to 4 o'clock. The spring is heavily impregnated with chlorides, and has a temperature of nearly 100° F. Since 1840 the water has been conveyed by pipes to the village of Ragatz (q.v.) below the gorge, a distance of about two and one-half miles, without losing its warmth. Near the village is situated the

ancient Benedictine abbey of Pfeffers, a vast edifice, built in 1665, and now used as a lunatic asylum under the name of Saint Pirminsberg. The abbot of this institution in the 10th century enjoyed independence of the civil government of the duchy. Up to 1838 the baths were controlled by the abbey.

PFAFF, pfäf, Christian Heinrich, German physician and physicist: b. Stuttgart, 2 March 1772; d. Kiel, Holstein, 24 April 1852. His interest in electricity was first awakened by the celebrated experimenter Gross. He was graduated as a physician at Stuttgart in 1793 and then went to Göttingen, where he published the results of his galvanic inquiries in 'Ueber thierische Electricität und Reizbarkeit.' In 1797 he became an extraordinary professor at Kiel and in 1801 was made professor of chemistry, physics and medicine there with rank at the same time as a member of the medical faculty. He then directed his attention particularly to pharmaceutical chemistry, and was thus led to the composition of his most important work, 'System der Materia Medica nach chemischen Principien' (1808-24). Among other writings of his are 'Handbuch der analytischen Chemie' (1824-25); 'Ueber und gegen den thierischen Magnetismus' (1807); 'Der Electromagnetismus' (1824); 'Parallele der chemischen Theorie und der voltaischen Contacttheorie der galvanischen Kette' (1845).

PFEIFFER, pfif'ër, Ida Laura Reyer, Austrian traveler: b. Vienna, 14 Oct. 1797; d. there, 27 Oct. 1858. She received the education usually given a boy and was married in 1820 to Dr. Pfeiffer, a lawyer connected with the Austrian government. Her first long journey was a trip to Palestine and Egypt when she was but five years old. The influence of this experience remained with her, and upon the death of her husband in 1842 she determined to travel. In that year she made a tour which included the Holy Land, Constantinople, Cairo, Arabia and the Red Sea, the Mediterranean and Rome, and later she again visited the Holy Land. In 1845 she visited Scandinavia and Iceland, and in 1846-48 made a tour of the world traveling in Brazil, Chile, China, India, Persia, Armenia, Caucasus and Turkey, and in 1851-55 made a tour which included England, South Africa, the Malay Archipelago, Australia and North and South America. Her last long journey was to Madagascar in 1856 and after many hardships and a narrow escape from death following imprisonment at the hands of Queen Ranavalona I, she returned to Vienna. Her travels covered 160,000 miles of sea routes and over 21,000 miles on land; a record which had never been approached by any woman traveler up to the time of her death. Among her works which have been translated into English are 'Journey of a Viennese to the Holy Land' (1843); 'Journey to the Scandinavian North and Iceland' (1846); 'A Woman's Journey Round the World' (1852); 'A Lady's Second Journey Round the World' (2 vols., 1855); 'Last Travels: Inclusive of a Visit to Madagascar' (posthumously 1861).

PFENNIG, a German monetary unit, equal to one-hundredth part of a mark. There are bronze coins of the value of one pfennig and two pfennige, or about one-fourth cent and one-half cent respectively. Nickel coins valued

at five and 10 pfennige are also in use, and in silver a coin of 50 pfennige, or about 11 cents.

PFEUFER, pfoi'fër, Karl von, German physician: b. Bamberg 1806; d. 1869. He secured his professional education at the universities of Erlangen and Würzburg; practised eight years in Munich, from 1840 to 1844 was professor at Zürich, from 1844 to 1852 at Heidelberg, and from 1852 to 1869 at Munich. Pfeufer acquired an international reputation for his rational system of explanation of pathological and other conditions. He published 'Ueber die Cholera Epidemie in Mittenwalde' (1837); 'Zum Schutz wider die Cholera' (1849; 3d ed., 1854) and important contributions to the *Zeitschrift für rationelle Medizin* (1844 et seq.).

PFISTER, pfis'tër, Albrecht, German printer: b. Bamberg, Germany, about 1420; d. there about 1470. He was engaged in card-painting in Bamberg and about 1455 began printing with movable type. It has been claimed for him by some writers that he is the real inventor of the art of printing, but whether he invented his process or learned it as an assistant of Gutenberg has been a matter of doubt. His types, though similar to Gutenberg's, have some peculiarities. He printed prayer and school books, some of which are still in existence, as are also 'Indulgences' printed with metal types in the years 1454-55, an almanac of 1457 and a 'Biblia Pauperum' (1462). His crowning achievement was his Latin 36-line Bible in three volumes and comprising 881 leaves. These were printed in part with worn type which, it is claimed, was formerly in use by Gutenberg. In Pfister's books published about 1461 appear the first known printed illustrations, in the form of crude woodcuts. Consult Dziatzko, 'Gutenbergs früheste Druckerpraxis' (1890).

PFLEIDERER, pfi'dër-ër, Otto, German Protestant theologian: b. Stetten, Württemberg, Germany, 1 Sept. 1839; d. Berlin, 20 July 1908. He was educated at Tübingen, and later in England and Scotland, and entered the ministry, serving at Tübingen and Heilbronn. In 1870 he became chief pastor and superintendent at Jena, and later was made professor of theology there. In 1875 he became professor of systematic theology at the University of Berlin, a post which he held till his death. He became widely known as a writer and lecturer, his inclinations being toward a liberal theology. His lectures in London in 1858 and in Edinburgh in 1894 were published in English. Among his works are 'Die Religion, ihr Wesen und ihre Geschichte' (2 vols., 1869-78); 'Religionsphilosophie auf geschichtlicher Grundlage' (1878-93); 'Geschichte der Religionsphilosophie von Spinoza bis auf die Gegenwart' (1893); 'Evolution and Theology' (English, 1900); 'The Early Christian Conception of Christ' (1905); 'Religion und Religionem' (1906); 'Christian Origins' (Huebach's translation, appeared in 1906); and 'The Development of Christianity' (by the same translator, in 1910).

PFLUGK-HARTTUNG, pfloog' här'toong, Julius Albert G. von, German historian: b. Warnikow, Germany, 8 Nov. 1848. He was educated at Bonn, Berlin and Göttingen, accepted the chair of history in the University of Basel in 1883 which he held until 1893 when

he was made head of the Secret State Archives at Berlin. He is an authority on mediæval and papal history and has published 'Studien zur Geschichte Konrads II' (1876-77); 'Norwegen und die deutschen Seestädte' (1887); 'Krieg und Sieg 1870-71' (1895); 'Die Bullen der Päpste bis zum Ende des zwölften Jahrhunderts' (1901); 'Weltgeschichte' (6 vols., 1907-10); 'Das Befreiungsjahr 1813' (1913); 'Belle-Alliance-verbündetes Heer' (1915). A number of his important works have been translated into English, among them 'The Great Migration' and 'The Early Middle Ages—by Wright' (Philadelphia 1902); and 'The Franco-German War,' by General Maurice (London 1900).

PFÖRZHEIM, pförts'him, Germany, the fourth largest (1914) city of Baden, 15 miles southeast of Carlsruhe, on the northern edge of the Black Forest, at the junction of the Würm, the Nagold and the Enz. Among its buildings are the remains of an ancient castle, formerly the residence of the margraves of Baden-Durlach; the castle church, dating from the 12th century, containing the tombs of many of the margraves; the townhouse, a handsome building, rebuilt in 1892-95; the post office; a fine museum, a gymnasium, and many other educational institutions. The chief industry of the place is the manufacture of cheap jewelry, which employs over 22,000 hands. There are also chemical works, machine-works, forges, tanneries, copper-works, bleachfields, paper-mills, oil-mills, saw-mills, etc. The trade in wood is important, the timber being floated by the Enz and Neckar to the Rhine. There is also a considerable trade in oil, fruit, wine and cattle. The inhabitants distinguished themselves in the Thirty Years' War. Reuchlin, one of the most distinguished precursors of the Reformation, was born here. Pop. 73,786.

PFUHL, pfool, Johannes, German sculptor: b. Lowenberg, Silesia, 1846. He was educated at the Academy of Fine Arts in Berlin and later became an assistant of Schievelbein, under whom he had studied, and after his master's death in 1867 completed his designs for the bronze memorial in the Dönhofsplatz, Berlin. His work includes several portrait busts, but his best work is seen in his colossal groups in relief. He has executed a frieze in rilievo in commemoration of the Franco-Prussian War, in the Military School of Lichterfelde (1876); an equestrian statue of William I, with Bismarck and Von Moltke, in Görlitz (1893); the Laube monument at Sprottau (1895); the Goethe monument (1902); the standing group of William I and Frederick (1902); the William I, of the Reichstag building (1905); and many others.

PHÆDO, fē'dō, or **PHÆDON** (Gr. φαίδων), philosopher: b. Elis. Having been captured in his youth, he was sold as a slave, and was brought to Athens by his owner B.C. 400. Freed through the influence of Socrates, he became one of his favorite students. After the death of Socrates, Phædo remained for a time at Athens and then returned to Elis, and there founded a school of philosophy of which no definite knowledge remains. The dialogue of Plato on the immortality of the soul, which contains the last conversation of Socrates with his scholars while he was in prison, bears his name; but no inference can be drawn from it as to

his teaching. None of Phædo's writings, which were in the form of dialogues, have come down to us; but Seneca, in his 'Epistolæ ad Lucilium,' has a translation of an extract from one of his works. Mendemenus, who founded the Eretrian branch of the Eleatic school, was indirectly a disciple of Phædo, but to what extent he expressed the views of his teacher has not been determined. (See SOCRATES). Consult 'Life' by Mendelssohn (Leipzig 1871).

PHÆDRA, fē'drā, in Greek mythology, daughter of Minos, king of Crete and of Pasiphaë, was the sister of Ariadne and wife of Theseus. Happening to meet Hippolytus, her step-son, whom she had never before seen, and whom she did not know to be the son of Theseus, she was inflamed with an ardent passion for the youth. He would not reciprocate, and to satisfy her revenge she accused him to her husband of a criminal attempt upon her honor. The father cursed his son, and Neptune soon carried his execrations into effect by bringing upon Hippolytus a violent death. When this event was known in Athens, Phædra repented of her crime and hanged herself. Seneca in his 'Phædra' and Euripides in 'Hippolytus' have taken Phædra as the subject of their tragedies, now lost.

PHÆDRUS, fē'drūs, Roman author. Little is known of him but from his own writings. He was a slave brought from the Pierian district of Macedonia to Rome, and manumitted by Augustus. By the publication of the first two books of his 'Fables' he drew upon himself the ill-will of Tiberius' minister, the all-powerful Sejanus, who imagined that he saw in the fables reflections upon himself and Tiberius. The remaining books did not appear until after the death of Tiberius in A.C. 37. Phædrus introduced the fable into Latin literature, and a prose version of his work, prepared by one Romulus, was the basis of the mediæval fable. He was less a translator than an imitator—not always skilful—of Æsop, from whom only a small proportion of his material is taken. The five books remain in an imperfect state. They are written with more or less fluency in the iambic senarius, and exhibit great purity of style. It seems from contemporary records that Phædrus was not appreciated in his own period. The best editions of the fables of Phædrus are those of Bentley (1726), Orelli (1832), Koch (1846), Lucien Müller (1877), Riese (1885) and Havet (1895). Besides the above fables some have ascribed to Phædrus another group of 32, the 'Epitome Fabularum' or 'Fabulæ Novæ,' published from a manuscript of N. Perotti, archbishop of Manfredonia in the 15th century. The genuineness of these is doubtful. It is at least certain that among the genuine are many written by others. Consult Hervieux, 'Les Fabulistes Latins' (1893-96).

PHÆOPHYCÆ, fē'd-fi-sē'ē, a division of *Algæ* (q.v.) containing the brown seaweeds, whose color is due to the pigment phycophæin. The group is almost wholly marine, and mainly inhabits the cold seas, flourishing especially in the polar regions. The group includes the great kelps (q.v.) and other large-leaved forms, many of which have commercial value, or do an important service in protecting shores against excessive erosion. The various 'rock-weeds' and 'gulf-weeds' also belong here. The sim-

plest *Phæophyceæ*, however, consist of single filaments. Reproduction takes place in a very variable manner. A sexual reproduction is the only means known in some forms, such as the kelps. It takes place by motile ciliated spores. Elsewhere sexual and asexual reproduction exist concomitantly. The sexual reproduction may vary between the fusion of equal free-swimming gametes and the fertilization of a non-motile egg by motile sperms. This latter mode of reproduction may form a stage in a definite alternation of sexual and asexual generations, or as in the case of *Fucus*, it may be the only mode of reproduction.

PHAER, or **PHAYER**, fā'ēr, Thomas, English author; b. Kilgerran, Wales, about 1510; d. there, 1560. He had a legal training and studied medicine at Oxford. He settled at Kilgerran in Pembrokeshire where he practised both professions; publishing two popular handbooks of law, and a number of booklets on medical subjects. From 1544 onward he wrote considerable poetry which was published locally. He translated in heroic ballad metre the first nine books of the *Æneid*, publishing seven books in 1558, but died before the completion of the other two. Oxford gave him the degree of M.D. a year before his death.

PHAËTHON, fā'ë-thôn, in Greek mythology, according to the myth most generally accepted, the offspring of Helios and Clymene, and brother of the Heliades. To please his unfortunate mother, and to satisfy those who doubted whether the Sun were his father, he desired the latter to grant him a favor. Helios imprudently promised it unconditionally. Phaëthon asked permission to take his father's place as driver in the chariot of the Sun, and would not be denied. But he had scarcely mounted the flaming car and taken the reins, when the celestial horses, despising the weakness of their mortal charioteer, turned out of the path, and set everything on fire. The Ethiopians, on the left, were blackened by the near approach of the sun; and when the chariot careened dangerously over the earth to the right, Zeus with his bolts plunged the helpless driver into the river Eridanus or Po. His sisters found him there lifeless, and lamented him. They were changed into poplars, and their tears into amber. The god of the sun was also called Phaëthon (the enlightener).

PHAETON, the tropic-bird (q.v.).

PHAGOCYTOSIS, a process of destruction of foreign bodies by living cells. The term was originated by Metchnikoff, the Russian scientist, who founded upon the process a theory of immunity to disease. He observed that in many infectious diseases there was an increase in the number of leucocytes or white blood-cells in the body. These were observed to be greatly increased in the neighborhood of an infected area, and he further noted that these leucocytes were capable of enveloping or swallowing as it were the invading bacteria, and destroying them by a process of intercellular digestion. The enveloped substance might, however, resist digestion, in which case it would be disgorged after an interval; or the organism swallowed might be the stronger and destroy the cell which engulfed it, and multiply at its expense. The white blood-cells were early termed by Metchnikoff the protecting army of

the interior, which always stood ready to annihilate the bacterial foe. He explained inflammation as a phagocytic reaction of the animal organism against an irritant, the phagocytes swarming to the affected locality, settling about the noxious bacteria and swallowing them. The injection of protective serums has been supposed by some to act through arousing the phagocytes to unusual activity. While this early theory rested upon a mechanical basis, and is now accepted only as to that view, it has nevertheless stimulated an immense amount of research along this line, and the general theories of phagocytosis are broader now than formerly, including distinct chemical reactions. It is now known that not all leucocytes are phagocytes; the lymphocytes are not; the eosinophiles are never phagocytic, although they are elements in the struggle of the body against infecting foreign bodies. The polynuclear and hyaline leucocytes are the chief agents in phagocytosis. It is further recognized that some of the fixed cells of the body have some phagocytic power. The endothelium that lines the blood-vessels can take up and destroy bacteria. Many epithelial elements, as in the mammary glands, and in the respiratory mucous membranes, can destroy bacteria; otherwise infections would be much more frequent than they are. The phenomenon of phagocytosis has been shown to be a much more complicated one than Metchnikoff at first supposed, but he has been able to defend and develop his theory with much skill in view of the many recent studies on immunity. It is certain that phagocytosis is an important mechanical process in the struggle with disease, but it is only one of the many biological agencies utilized by the body in this conflict. See BLOOD; IMMUNITY; INFLAMMATION.

PHALANGERS, fā-lān'jers, a group of small polyprotodont marsupials, which owe their name to the fact that the slender fourth and fifth toes of the hind feet are united in a common integument. They have thick woolly coats of such density as to repel a charge of shot from an ordinary gun. The great toes are opposable, and are destitute of nails, the other digits being provided with curved nails. Some varieties have prehensile tails. The phalangers are about the size of the house cat, and are adapted for an arboreal life. They inhabit the trees of the forests of Australia and the Papuan Archipelago. They are nocturnal in habits, and feed upon fruits and leaves, but some varieties also devour grubs and young birds. In confinement they are found to prefer flesh as an article of diet. They are eaten by the natives of the countries in which they occur, although the flesh is said to emit a strong and offensive odor.

These animals are grouped in a family (*Phalangeridæ*) which is composed of several sub-families. The *Tarsipedinæ* contains the genus *Tarsipes* alone. In the *Phalangerinæ* are included 10 or 12 genera and numerous species, among them the typical phalangers, the flying-phalangers and the flying-mouse. The largest of them is the "vulpine" or true phalanger, exemplified by *Trichosurus vulpecula*, the size of a small fox. The flying phalangers are provided with a parachute-like expansion of the skin between the fore and hind limbs; by which they can make long skimming leaps from tree to tree as do the flying-squirrels of northern

countries. The foremost genus is *Petaurus*, and the best known species is *P. breviceps*, which bears a remarkable resemblance to an American flying squirrel, but is somewhat larger. The flying-mouse is the minute *Acrobates pygmaeus*, which is not more than six inches long, including the plume-like tail. The koala and wombat (qq.v.) are also phalangers.

PHALANGES. See ANATOMY; OSTEOLOGY.

PHALANGIIDÆ, fāl-ān'jid-ē, a family of arachnidans, the daddy-longlegs (q.v.) or harvestmen, one of six families of the order *Phalangida*, or with scorpions and false scorpions constituting the order *Arthrogastra* of Packard. The distinguishing feature is the fact that the abdomen is distinctly six-segmented, instead of the usual nine, but the cephalo thorax is unsegmented. The legs are very long in most species though relatively short in others, and are many-jointed. The pedipalps are short and leg-like, the last segment with a claw at the end, and the chelicerae three-jointed and chelate. The organs of respiration are tracheae, and there are no spinning-glands. These creatures live in the grass for the most part, and feed upon plant-lice and other minute insects. Many common American forms may be found described and illustrated by Wood, in the *Proceedings of the Essex Institute* (Salem, Mass.), Vol. VI. Consult also Comstock, J. N., 'The Spider Book' (Garden City, N. Y., 1912).

PHALANSTERY. See FOURIERISM.

PHALANX, fāl'lānx or fāl'ānx, a word used by the Greeks to designate the mode of formation of the heavy infantry of the Greek armies. Three Greek states acquired renown for their superior organization and use of the phalanx—Sparta, Thebes and Macedon. In all of them it consisted of several ranks of infantry in close array, armed with long spears as their principal weapon. The organization of the troops composing the phalanx varied in different states, but generally they were arranged in regular divisions under officers of various ranks, as in a modern army. The Spartan phalanx varied in depth, according to circumstances, but was commonly eight ranks deep. The Theban phalanx, particularly under Epaminondas, was much deeper, reaching 12 ranks, the longest spears being 18 feet long. At the battle of Leuctra he kept one of the two divisions into which the phalanx was usually divided retired, using it to strengthen the other wing in depth. The phalanx was perfected by Philip of Macedon. He increased the length of the spears to 24 feet and the number of ranks to 16; and the lines were arranged at such intervals that the spears of the fifth rank projected three feet in front of the first, so that the front was protected by a solid array of five lines of spears. The men were also armed with large shields which nearly covered the body. The rush of the phalanx was well-nigh irresistible, but it was unwieldy, and was abandoned because it could not be manœvered quickly and failed altogether when the fighting became hand to hand.

PHALARIS, fāl'a-rīs, ruler of Agrigentum in Sicily remembered as the "Tyrant": b. near Cnidus, Asia Minor, 6th century B.C. He ascended the throne about 570 B.C. and though apparently elected by his fellow citizens appears

to have usurped despotic authority. His history is largely enveloped in fable, and his name has become symbolical of savage cruelty, his most infamous act being the roasting alive of prisoners in the brazen bull, in which he is said to have first executed its inventor, Perillus. In an insurrection 16 years after his accession to the throne Phalaris himself was overthrown and tortured in the same horrible manner. Later traditions attempted to paint him as a humane and high-minded ruler on the strength of the 'Epistles of Phalaris,' 148 letters (first printed in Venice, 1498) attributed to him. But these were proved by Richard Bentley (q.v.) in 1697-99 to be spurious. Consult Freeman, E. H., 'History of Sicily' (New York 1892).

PHALARIS, a genus of grasses, of which the fruit of one of the species (*P. canariensis*) or canary-grass, is canary-seed extensively employed as food for birds. See CANARY-SEED; GRASSES OF THE UNITED STATES.

PHALAROPE, a snipe-like shore bird of the Northern Hemisphere belonging to the family *Phalaropodidæ*. They are from seven to nine inches in length and have a straight slender beak and lobate toes, enabling them to swim well. The females are larger than the males, more brightly (and very handsomely) colored and more aggressive than their mates. These birds spend their summers in the Arctic regions and nest in a shallow cavity in the ground dug and lined with grass by the male. The female lays three or four very dark-colored eggs of olive-gray blotched with chocolate. These are incubated by the male alone. Their flesh is oily and of poor taste. In winter they migrate southward, spreading over both the Old World and the New. Two of the three appear commonly in the United States,—the northern phalarope (*Phalaropus lobatus*) which in winter passes numerous all along the Atlantic Coast; and the distinctively American variety, Wilson's phalarope (*Steganopus tricolor*), the largest of all rare on the coast but common all over the Rocky Mountain region and breeding in northwestern Canada as far south as the borders of Dakota. It is an esteemed game bird in the mountain lakes of the high Western Plains. The red phalarope, or gray phalarope (*Crymophilus fulicarius*), is rare here, but familiar in Europe and Asia. It is thus variously called because of its rich, brownish-red plumage in summer changes to gray (and white) in winter. Consult Coues, E., 'Birds of the Northwest' (Washington 1874); Forbush, E. H., 'Game Birds, Wild-Fowl and Shore Birds' (Boston 1912).

PHALLACEÆ. See FUNGI.

PHALLICISM. A form of nature worship which particularizes upon reproduction as symbolized by the sex-organs. The fact determinant for phallicism was the discovery by primitive man of natural objects resembling the male (Greek, phallos) or the female (Greek, kteis) organ of generation. A roughly cylindrical stone or rock was considered an erect penis; a stone or rock, amorphous in general but showing any sort of cleft, was considered an opened vulva. Wherever a further correspondence of size or color (red for male, black for female) appeared, the object was all the

more esteemed. The term *ithyphallie* "erect phallos" is superfluous, since all phallic symbols are erect.

Among all the varied objects of man's worship, alike in the mineral, vegetal and animal worlds, this phallos and kteis enjoyed the distinction of correspondence of form to the necessarily and therefore invariably, human-like deities that man sought to discover and to influence as the controllers of his changing fortunes. Such resemblance would afford the most powerful aid possible to that nature-worship which, co-ordinate with ancestor-worship, mediated all forms of religion. Man is the measure, here as in every other cultural. In consonance with these facts and this principle, phallicism was both a primitive and a universal practice. It combined admirably with the likewise obvious, primitive and universal myth that the outstretched Father Heaven discharges the fertilizing rain into the lap of recumbent Mother Earth, who then teems with all living things. Phallicism still so combines in the cosmologies of the Japanese; but by other people has been associated with various other nature-gods distinguished for productive energy, as will appear in the following ethnical sketch.

An original phallos and kteis are sometimes found in the same region, occasionally in proximity; otherwise a phallos is made for the kteis or a kteis for the phallos. The same sex-dualism prevails for the later deities in all religions, with few exceptions. An adequate term for the system would therefore be phalloktenism.

That phallicism was not solely a species of magic, but a form of religion is evident from the use of phallos or kteis as an idol whether under a shrine or in the open, the offering to them of food and drink, or the presentation of small duplicates as votives, accompanied by petition or thanksgiving. This use of the artificial phallos as a votive led to its facture by thousands in stone, wood, iron and clay. No artificial kteis is known to be used as a votive to either the phallos or the phallos with kteis. Other uses of the phallos dispense with all cult and must therefore be regarded as magic of the sympathetic type. The purpose of phallicism was naturally to secure fertility equally of cereals, animals and humans. Phallic festivals sometimes permitted sexual liberties beyond the laws commonly observed.

Phallicism was freely practised throughout Japan until in 1872 foreign influence began to suppress it, but in-yo-seki, "female-male-stone" may still be met in the remoter regions. Natural phallos and ktenes occur in all sizes from rocks, one of which formed a whole islet, named Onogoro, down to pebbles. No artificial ktenes are made but the *awabi* (haliotis) shell is offered as votive to a phallos by infertile or sick women. Artificial phallos are wrought in great numbers for use as votives to a natural phallos or a phallos-kteis. Also a large artificial phallos may be placed near a natural kteis to complete the pair. The peach and the bean are used also as symbols of the kteis and the mushroom and the hog's snout similarly for the phallos. Phallos and kteis are credited with promoting pregnancy, parturition and the cure of all diseases of the generative system. The phallos serves also as symbol of the road-god and as patron-god of harlots, a small specimen

often appearing, among other symbols on the *kami-dana* "god-shelf" of the house. The offerings made to phallos and kteis are the usual ones of food, drink and light. This cult aptly interprets the cosmology given in the Kojiki that Izanagi (Male that invites) and Izanami (Female that invites) stirred the ocean with "a jeweled spear," which dripped from its end the sea water that made the islet Onogoro. The naked pair then ran around a "heavenly pillar," and begat the remaining islands of Japan. Since the phallos was life-giving, it could also avert diseases and other ills, which traveled, as men do, on roads and therefore became road-god, appearing on road-sides and cross-roads. Such deities were the Sahe no Kami "Preventive Deities," comprising an Eight-road-fork Prince with a consort, Eight-road-fork Princess and a third, Kunado. They had no temples and their festivals were held at cross-roads. Another phallic road-god was Dosojin "Road-ancestor deity," a popular name for Saruta-hiko of the Kojiki, represented by a natural boulder, often with a pile of stones before it. These deities were supplicated by travelers before starting on a journey and were also invoked in *tsuji-ura*, a form of divination conducted at cross-roads. At a few famous phallic shrines, the annual festival has permitted promiscuous coition.

Several popular sex-myths are reported in Mayer's "Chinese Readers Manual," several sex-ceremonies are described in De Groot's "Fêtes Annuelle à Amoui" and M'Clatchie construes the trigrams as conventionalized sex-symbols, yet no phallicism has been discovered in China. Chinese scriptures, both the king and the shu are devoid of sex-myths, as unimaginative as are the Chinese tablets, ideographs, literature and entire culture.

Phallicism, prehistoric in India as elsewhere, but unknown to the Veda, was only later united with Rudra, a storm-god as chief trait in Siva, god of destruction and reproduction, symbolized along with his wife, Kali, in millions of *linga-yoni*, a mere stone cylinder or cone erect upon a stone disc. Natural—large stones or rocks—*linga* are considered of their own nature pervaded by the essence of Siva, so that shrines are built over them and a *yoni* is then usually added. Not less sacred are certain pebbles found in rivers. Two such are oval shaped, one being the *bana-linga* of white quartz, for Siva and another the *sala-grama*, a black pebble containing ammonites—fossil shells—the spiral of which suggested the serpent, for Vishnu. These two, with a bit of metallic stone for Ganesha and a crystal for Surya, are used in the *panchayatana*, the daily household rite in India. The cult of the *linga-yoni* consists in decorating it with flowers, pouring milk over it, and wrapping it with bilva leaves, in order to allay its irritation. Vigil and fasting accompany this cult on the great Sivaite festival, 27 February. Artificial *linga-yoni* need "endowment with breath," namely consecration by a Brahman. The Sankhya philosophy regards the *linga-yoni* as symbols of the eternal principles: Prakriti, the one creative force or matter, female; and Purusha, innumerable spirits, male. But among the masses phallicism promotes sexual excesses in the cult of Siva's consort, one of the forms of Sakti (the female energy in nature) and by obscene carvings and pictures

in the Sivaite temples, though no more of either practice than the unrelated Vaishnavism presents. Both systems are products of the Indian heredity and environment.

Tibetan Buddhism probably derived its prayer-wheel formula, "*Om mani padme Hum*," from Saivism, with the meaning "*Om Jewel (the *linga*) lotus (the *yonis*) Hum*." In the East India Islands phalloi figure as members on the statues of ancestral deities and are accompanied by crocodiles as symbols of bravery, the other chief male attribute.

The primitive phallicism of Greece was later adopted by several cults. Dionysos was celebrated in a rite (resembling that of the consort of his Indian analog, Siva) where phallos and kteis were borne in procession, sacrificial victims were torn apart and devoured raw, wine drunk, and dancing with wild cries practised, all ending in coition under cover of darkness. Out of the coarse humor inseparable from such scenes, Greek genius developed comedy. In the Thesmophoria, celebrated by women alone in honor of Demeter and Kore, phalloi and snakes made of dough were carried about with fir-cones and dedicated to these goddesses of agriculture. Concurrently the participants indulged in flitting indecent chaff, doubtless with the purpose of stimulating reproduction in both earth and humans. The Halaoa, a festival in honor equally of Demeter, Kore and Dionysos, resembled the Thesmophoria, but here the symbols represented both sexes and the priestess whispered into the ears of the women present words that might not be uttered aloud. Both phallos and kteis were used also at the Eleusinian mysteries; some authorities think with the usual symbolism of fertility, while others believe that they connoted rebirth after death. The minor deity, Priapos, showed by the conspicuous phallos of his statues that he represented the merely sensuous factor in reproduction. At Greek marriages a phallos, with other symbols of plenty, were carried in the *liknon*, doubtless as a charm to produce the thing signified.

The phallic deities native to ancient Rome are unfamiliar to the modern reader, because they were early identified with correspondent Greek deities and thenceforward passed under Greek names. Such were Mutunus identified with Priapos and Liber with his consort Libera, identified with Bacchos and Aphrodite. Liber and Libera were represented in their shrine simply by a phallos and kteis. The extreme grossness of this cult is evidenced by the bronze figures now preserved in the Naples Museum. As late as 1781 Sir William Hamilton could collect votive phalloi in Naples and forward them to the British Museum. Phalloi were widely used by the children of ancient Rome as amulets and are still so used in Italy.

The three great gods of northern Europe were represented (according to Adam of Bremen) at Upsala in Sweden by three images: Odin (or Wodan) as a warrior in mail, Thor with his sceptre holding, as greatest god, the middle place, and Freyr with his customary phallic symbols of fecundity and peace. Evidence of a similar cult in France and Belgium remained during the Middle Ages and later in the practice of supplicating phallic saints, such as Saint Foutin, for offspring or the cure of venereal disease. As late as modern times fe-

male figures with conspicuous vulva appeared in carving over church doors in Ireland and England, but most of them have now been removed. Those in Ireland were called *sheilana-gig*. Definite evidence in some cases and survivals in others show that throughout mediæval Europe spring festivals usually culminated in sexual orgies. A survival from phallic symbolism in the druidical use of the significantly shaped mistletoe appears in its exclusion from church decorations at Christmas, but its welcome to hang in every house, where it licenses kissing beneath its bough. Also English farmers used to decorate with mistletoe the first cow to calve in the New Year.

Turning to the Semitic peoples, we find Baal and Astarte (Istar, Baalat) worshiped together, commonly under the form of a stone pillar called *masseba* and a tree or stake called *ashera*. Monuments and records indicate that these were just a phallos and kteis. This cult, as practised by the Canaanites, proved a licentious snare to the Israelites who were urged by their prophets "to dash in pieces" the *masseba* and "to cut down" the *ashera*. (Exodus xxxiv, 13, Revised Version). A "cleft in a rock" served as natural kteis and the "smooth stones of the valley" as phalloi, doubtless in Palestine as everywhere else. (Isaiah lvii, 5-6, Revised Version). The unconvincing arguments of Robertson Smith and the Encyclopædia Biblica against this view have been disproved by recent excavations of phalloi from the ruins of Nippur and of Tell Lob in Babylonia and at Lachish, Gezer and other sites in Palestine.

In Egypt the phallos was attached to the images of Min (Khem), old father Nature, accompanied by his consort, the cow-horned Hathor, a pair upon whom all the force and pleasure of life depend. Furthermore, the phallos of the great creative god, Osiris, is prominent equally in his myth, his representation and his ritual. Phallicism is current among the Tusa-yans, Pueblos and other Redskins of North America; and its symbols have been found in Mexico, Central America, Peru and other parts of South America. As examples of phallicism in West Africa there may be cited the Ewe-Speakers, the Yoruba and the Dahomeyans.

EDMUND BUCKLEY.

PHALLUS (Greek, *Phallos*), a symbol of the productive principle of nature as exemplified by the male sex in contradistinction to the female. See PHALICISM.

PHANARIOTS, fa-năr'i-ôts, or **FANARIOTS**, Greek inhabitants of Fanar, Constantinople. They were of Byzantine descent and when Mohammed II conquered Constantinople he granted them the quarter of Fanar in recognition of their services. The district takes

its name from the "beacon" which stood on the promontory extending into the Golden Horn. The Phanariots were descended from some of the oldest and noblest Byzantine families, and their superior intelligence soon gained for them a dominant influence over the ignorant Turks. Among them were poets and dramatists of considerable renown. They were ambitious, avaricious and double-dealing, and their subtle intrigue soon gained for them high political places, in which they displayed much selfishness and greed. The offices of dragomans, secretaries, etc., were filled by them as well as many civil offices and the hospodars of Moldavia and Wallachia were appointed from their ranks from 1716 to 1821. Their position became one of great power and importance, but they never showed any appreciable degree of patriotism and when the war of Liberation broke out their services fell far short of the importance which their wealth and position should have made them. Since the revolution (1822) their power has been broken and as a class they have no longer any political influence in the affairs of Turkey. Consult Tennent, 'History of Modern Greece' (1845).

PHANEROGAMS, the class of the flowering plants; those in which the sex processes are plainly observable, as distinguished from the Cryptogams, in which these processes are concealed. Neither of these terms is strictly accurate, but they are in common popular use. See CRYPTOGAMOUS PLANTS.

PHANTASIASTS, fān-tā'zī-asts, Monophysites of the 6th century, who believed that the Divine nature had so transformed the body of Jesus from the very moment of His conception that His apparent body had become ethereal, imperishable and immortal. It felt neither hunger, thirst, fatigue nor pain, but only semblances or phantasms of these affections, and His whole human "life" was only a vision, and that He did not and could not from his spiritual nature suffer and die upon the cross. Prominent among the adherents of this sect were Julian, the bishop of Halicarnassus, and, in his latter days, Justinian (q.v.). They were known also as Aphthartodocetæ Docetæ, and were grouped with others under the title of Manichæans.

PHANTASMAGORIA. See MAGIC LANTERN.

PHARAOH, fā'rō, the Hebraic name given in the Bible to the kings of Egypt, corresponding to the PER-O (Great House), P-RA or PH-RA of the Egyptian hieroglyphics, which signifies the sun.

The Pharaohs mentioned (Gen. xii; 10) in the time of Abraham (believed to be Osirtesen I) and Joseph (the latter, according to tradition, minister of Apophis II Aa-Kenen-Ra), were probably the shepherd kings or Hyksos. The Pharaoh in the time of Moses, 200 years later, was Rameses II, the Sesostris of the Greeks. He was succeeded by his son Menepthah II, and the Exodus took place either under the latter, or in the reign of his successors Seti II and Ei-Ptah. The two Pharaohs mentioned in the reign of Solomon, the one who gave his sister-in-law to Hadad the Edomite, and the one whose daughter Solomon himself married, were the last kings of the 21st dynasty. The Pharaoh mentioned as the op-

ponent of Sennacherib was probably the Sethos of Herodotus. Pharaoh-Necho is the first Pharaoh mentioned in the Bible whose proper name is recorded. He is mentioned by Herodotus under the name Nekôs. He was the king of Egypt during the reign of Josiah, Jehoahaz and Jehoikim, kings of Judah. Pharaoh-Hophra succeeded Necho. He is identified with Apries, who reigned from about 590-571 B.C., but the dates of both the beginning and end of his reign are variously stated. He is the last Pharaoh mentioned in the Bible narrative. Several kings of Egypt are mentioned in the Bible who are not called Pharaoh. See EGYPT.

PHARAOH'S ANT, the tiny red ant (*Monomorium pharaonis*), which is a household pest in almost all parts of the world. It makes its nests in the walls or under the floors of houses, and forms long trails to any bit of acceptable food that may be discovered, preferably sweets or some kinds of cooked meats. Within a few hours such dainties may be taken possession of by swarms of ants numbering tens of thousands. Why it is so called is not clear. Several other familiar and troublesome animals are called by the royal name as "Pharaoh's hen," the Egyptian vulture (q.v.), and "Pharaoh's rat," an ichneumon (q.v.). Consult Lubbock, Sir J., 'Ants, Bees and Wasps' (London 1882); Wheeler, W. M., 'Ants: their Structure, Development and Behavior' (New York 1910).

PHARISEES, a religious sect of the ancient Hebrews who based their division from other sects upon their unbending adherence to the Mosaic laws governing the division between the clean and the unclean. This party probably became a distinct sect as a result of the reaction against the attempt of Antiochus Epiphanes to eliminate the distinctions between the Jews and the Greeks, and as a party were in opposition to John Hyrcanus, the high priest (135-105 B.C.), who reigned over the state founded when the Maccabean revolt was brought to a successful termination. They were also in opposition to the Sadducees, being essentially a religious sect, opposed to anything non-Jewish, and rarely engaged in political strife unless some of their rights or privileges had been outraged. The principles of the Pharisees were many and varied. As their name signifies (separatists), they held aloof from all intercourse with the lower classes; even their orthodox countrymen, unless they lived up to the Pharaic interpretation of the laws, were shunned by them; and they carried their religious fanaticism to such an extent that laws were even imposed upon members of their body prohibiting trade with disbelievers. They, however, worshipped with their countrymen in the same synagogue under the command of their great rabbi: "Separate not thyself from the congregation." They insisted upon a strict observance of the laws as being necessary to righteousness, though they placed more weight on the belief in traditional laws than on the written laws, and extended the observance of these laws to the tithes, fasts, Sabbath worship, the ablution of hands, vessels, etc. Especially in the matter of tithes they preserved rigid watchfulness, holding that only food which had been tithed could be partaken of without sin. This was the preliminary re-

quirement imposed upon candidates for admission to the sect. Among the Pharisees themselves there were four ranks of purity, according to the degree of cleansing practised by the individual. They also believed in the existence of an oral law to complete and explain the written law (the Torah), in which was set forth the continuance of life after death, the immortality of the soul, the resurrection of the dead, human freedom, providence, etc. We find in the Mishna that "Moses received the law from Sinai, and delivered it to Joshua and Joshua to the elders, and the elders to the prophets, and the prophets to the men of the great synagogues." In the course of time these laws received many additions which were not supposed to be of divine origin, but were made by both the writers of the sacred books and the commentators.

The Pharisees came into prominence more particularly in the time of Christ because of their opposition to the principles of religion as taught by him. But their main objection to Jesus and the disciples lay in the fact that they associated so freely with the publicans and sinners, this being in direct contradiction to all the traditions and beliefs of the Pharisees. Jesus also taught that the religious relationship should be one of personal fellowship, while with the Pharisees this was held to be one only of legal compact. This doctrine the Pharisees perceived, if allowed to gain influence with the people, would lose to them their power, hence their desire to be rid of him, even if by death.

The Pharisees have, however, been misunderstood and maligned, especially as to being hypocritical. This party was the popular party of the day, having as members some of the most learned, pious and patriotic men of the country, and, as in all sects where strict adherence to principle is an intensely religious duty, some defects of virtue crept in, but to stigmatize all as insincere and hypocritical is beyond reason. It is to be remembered that Simeon, Zacharias, Gamaliel and Paul of the Bible narrative were all Pharisees.

Josephus is authority for the assertion that under the Herods the number of the Pharisees exceeded 6,000. The sect survived until long after the fall of Jerusalem in 70 A.D., still believing in the restoration of the kingdom of Israel through divine mediation. Consult Delitzsch, F., 'Jesus und Hillel' (Erlangen 1866; Monkhouse trans., London 1877); Milman, H. H., 'History of the Jews' (London 1863).

PHARMACEUTICAL SCHOOLS. See EDUCATION, PROFESSIONAL, IN AMERICA.

PHARMACOPEIA, fār'ma-kō-pē'ī-ā, a book of directions or formulæ for the identification and preparation of medicines which has received the official sanction of the government, or at least that of a responsible body of practitioners. Such a book is issued in every leading country, and contains a list and description of the substances used in the treatment of disease and included in the *materia medica* (q.v.), with the chemical processes for obtaining them, their purity-tests, the prescriptions most approved, etc. The object of the pharmacopeia is to so standardize drugs as to secure a uniform compounding of prescriptions by pharmacists. After 1542 when the first

pharmacopeia, that of Nuremberg, appeared, these books gradually superseded the treatises of apothecaries and increasingly acquired a more authoritative character. In 1618 the London College of Physicians issued its pharmacopeia, of which 11 editions afterward appeared, the last in 1851. Until the passage of the Medical Act in 1858, separate pharmacopeias were published by the colleges of physicians of London, Edinburgh and Dublin. Since that act went into effect a British pharmacopeia issued by the medical council of the United Kingdom has been recognized by the general medical profession of Great Britain.

The pharmacopœia of Prussia, which is used throughout Germany and the "Codex medicinalarius" of France, in use also in most of the countries of South America and in Turkey, are the most important published in the continental countries of Europe.

In the United States the first pharmacopeia was published in Philadelphia in 1778; in 1805 appeared another in New England; others were afterward issued by hospitals and other medical institutions; and in 1818 medical societies in New York planned a convention of delegates from medical colleges and societies in the various States, which was held in Washington, January 1820. Out of the transactions of that convention came, in the same year, the first pharmacopœia published in the United States. This was called 'The Pharmacopœia of the United States of America,' and was printed in Latin and English at Boston. A second edition of this pharmacopœia appeared in 1828. In 1830 two others appeared, one published in New York and the other in Philadelphia. These were eventually combined and a second edition issued in 1842. The third edition was published in 1851, and a revision in 1855. The fourth revision was issued in 1863, and the fifth in 1873. In 1882 the sixth edition appeared, and steps were taken to secure government sanction. The medical officers of the army and navy were enlisted in a new revision which was published in 1893 and was made the official pharmacopœia of the United States. It is not required by Federal law that this pharmacopeia shall be followed in the medical practice of the country, but it has been adopted as the legal standard in many States.

At the International Conference for Unification of the Formulas of Heroic Medicines, at Brussels, each country being represented by a physician and a chemist, new standards of strength for all very potent drugs were agreed upon and pledges were made by each government that the national pharmacopœia should conform. The new 'United States Pharmacopœia' has adopted the results of the Brussels conference, and it will be the first national pharmacopœia of international scope.

Revision of the Pharmacopœia.—National regulation of the purity and strength of drugs was still in the future when the eighth revision of the Pharmacopœia (held in 1900) became official, 1 Sept. 1905. The Federal law which bears the short title "The Pure Food and Drugs Act, June 30, 1906," was passed the following year, and became operative on 1 Jan. 1907. This law specifically designated the Pharmacopœia as the legal standard, and thereby gave it a standing which it had not previously attained. The vigorous manner in which the authorities pro-

ceeded to execute the law, at once caused thousands who had known the book simply as a name, or not at all, to buy or use it. The Pharmacopeia has thus become a part of the Federal law, as well as of the laws of many of the States which enacted statutes based on the Federal Pure Food and Drugs Act; and since the organization which owns and controls it is an incorporated body, the meeting of the United States Pharmacopoeial Convention, for the last revision of the work, which took place in Washington 10-12 May 1910, exceeded in importance any of the conventions which had previously been held to make or revise the book. The far-reaching effect of the work of manufacturers and importers, retail pharmacists, food and drug officials, and practitioners of medicine made it important that each of these interests should be well represented in the convention. Wholesale and retail druggists' organizations and medical societies had been discussing the Pharmacopeia with a view, particularly, to protect the public against the evils of low-grade drugs, and at the same time safeguard their own interests by impressing upon those most interested the importance of considering the interests of all concerned.

The United States Pharmacopoeial Convention is itself an incorporated body, chartered under the laws of the District of Columbia 7 July 1900, and is continuous, with power to conduct future revisions under the constitution and by-laws framed by the convention.

The convention for the 9th decennial revision was held in the New Willard Hotel, Washington, and was attended by about 325 delegates, representing about 157 medical, pharmaceutical and chemical societies and associations, government departments, etc. The report in detail of the action of the convention is published officially in *The Druggists Circular* for June 1910.

The revision became official 1 Sept. 1916. Among the recommendations adopted by the convention was the following proposed limit to the scope of the Pharmacopeia:

"We recommend that this committee of revision be authorized to admit into the Pharmacopeia any medical substance of known origin; but no substance or combination of substances shall be introduced if the composition or mode of manufacture thereof be kept secret, or if it be controlled by unlimited proprietary or patent rights, and the list of substances should be carefully selected, with standards for identity and purity, as far as possible. Substances used only for technical purposes should not be admitted to the next Pharmacopeia, and a statement should be placed in the preface to the effect that standards of purity and strength prescribed in the text of the Pharmacopeia, are intended solely to apply to substances which are used for medical purposes or in determining the identity and purity of the same."

Another of the "general principles" of revision adopted was:

"That the committee be instructed to revise as carefully as possible the limits of purity and strength of the pharmacopoeial chemicals and preparations for which limiting tests are or may be given. While no concession should be made toward a diminution of medicinal value, allowance should be made for unavoidable, innocuous impurities or variations due to the

particular source or mode of preparation, or to the keeping qualities of the several articles. The 'purity rubric,' which limits the percentage of innocuous impurities, as introduced into the eighth revision, should be continued, and tests and requirements should be appended to each article carrying a 'purity rubric.' In the case of crude drugs and natural products, the limits of admissible impurities should be placed at such a figure as to exclude any that would not be accepted by other countries." Consult Flint, J. M., 'Report on the Pharmacopœias of All Nations' (Washington 1883).

PHARMACY. Definitions.—(1) Pharmacy is the art of preparing and dispensing remedial agents. (2) The term Pharmacy is also applied to the place (shop or store) where medicines are prepared or sold, for example, a drug store or apothecary's shop. The pharmacist is the operator or dispenser, known also as druggist, or pharmacist (in England, chemist or pharmaceutical chemist). The product of the pharmacist's skill is called a pharmaceutical preparation or compound. At present, owing to the evolution that has largely transferred to manufacturing establishments, or factories, the making of specialties, and many compounds employed by physicians, such trade compounders are known as manufacturing pharmacists. Thus the differentiating terms retail pharmacist and manufacturing pharmacist now prevail.

The word pharmacy, derived from the Greek word *φάρμακον* signified in early times either "the use of medicine" or "the practice of witchcraft." The past record of the art, in all countries, seems to be fairly outlined by these definitions. In all cases, the early record of pharmacy is intricately connected with the practice of medicine, nor is it possible to write the history of one, without entering, somewhat circumstantially, into the story of the other.

Beginning of Pharmacy.—The beginning of the practice of pharmacy may be located in the efforts of primitive people of all ages to counteract disease or to relieve injuries. The very earliest literature of all nations gives proof of the study, as well as does the practice of the aborigines of every land. Scriptural reference to the "dead flies in the ointment of the apothecary," the fig poultice applied by Isaiah, and the many references in Jeremiah and elsewhere in the Scriptures to the medicinal virtues of leaves and plants are familiar to all readers of the Bible, and give proof of the practice of the art of pharmacy among the Hebrews.

In Assyria, cuneiform inscriptions teach that the healing art was practised by the priesthood at a very early date.* Ancient Egyptian inscriptions¹² illustrate the process of distillation, while a papyrus 3300 years B.C.¹ gives prescription formulae. Recent explorations have brought to light the interesting code of Hammurabi, king of Babylonia, 2250 B.C.,³ in which we read of the doctor healing the sick, and the surgeon operating with the knife, but in which we find no reference to the compounding of medicines. By inference, then, we know that the physician and the pharmacist of ancient Susa must have been identical, since it is to be presumed that, had this not been the case, a

* For references see end of article.

document embodying such minutiae of details in law would have considered penalties for pharmacists' blunders, as well as for medical and surgical malpractice. In China and Japan, pharmacy, coexistent with their earliest records, is a curious art, while India, as shown in its "Charaka-Samhitā"⁴ (8th century, or earlier), is to be credited with a wonderful detail study of drugs and simple pharmaceutical preparations.

Glancing rapidly over the history of the world, we find in all countries and in all ages a like development of the pharmacist's art. Swayed originally by religious principles, the people looked naturally to the priest as councilor and helper, for physical as well as for moral ailments. In mediæval times, "Christ as an Apothecary," surrounded by the well-known implements of the art, was the subject of more than one painting. Of the semi-barbarous tribes of mediæval history, the Druids, who were held in such veneration by the people that their authority was almost absolute, were especially proficient in mystic rites and medicine.⁵ It is recorded that "the nine rural arts known and practised by the ancient Cymry, before they became possessed of cities and a sovereignty," which was before the time of Prydain ab Aldd Mawr, about 1000 B.C., was medicine.⁶ The aborigines of America attained a considerable skill in pharmacy, as is evidenced by a collection in our own possession, of stone mortars from prehistoric Kentucky tombs, and lava mortars employed in the processes of making remedies and face paints, from the habitations of the lost Arizona Mound Builders. In fact, the records of early man, everywhere, give evidence of some form of the practice of medicine, and the rudiments of pharmacy. Said the erudite Dr. Alexander Wilder, "Every country having a literature of ancient periods of its history, possesses some account of a healing art."⁹

The early healing arts, among primitive peoples, were dominated by, or connected with religious rites, and consequently, with such, "the functions of the physician are usually united with those of the priest and civil ruler,"⁷ to whom was relegated both the compounding and the administering of drugs. Ignorance and superstition led naturally to belief in sorcery, charms and witchcraft, as well as to confidence in the priest-physician, and faith in the wisdom of philosophers, astrologers, believers in divinations and the charm of soothsayers.⁸ Hence we find the secondary meaning of the word *φάρμακον* to be sorcery, with which the primitive practice of medicine (and pharmacy) was often most intricately complicated, a practice exemplified to-day by belated people, for example, by the "pow-wow" methods of the American Indian "Medicine Man," and the "Ordeal Tests" of the African. The separation of the duties of the physician as we know him, from the offices of the priest or charm healer, came as a natural sequence to civilization's progress, and marks the first step in the development of the pharmacist.

Evolution of Pharmacy.—For a long period this process necessarily consisted of a picking out, or establishing, of remedial agents, and an excision of religious ceremony. By slow degrees, the sacred groves and pagan temples lost the confidence of the people as hospitals for the sick, and priests and mystics were

no longer regarded as special physicians for disorders of the body. The magic touch of a love draught, or philter, the legendary "cry of the mandrake root," the casting of the horoscope, the influence of metals, plants, constellations, the foreboding bad sign, and the acts of witches and wizards, these and such as these became severally less conspicuous, and were gradually eliminated from the domain of medicine. A majority of such remedial agents as were used even to the very door of the 19th century, were likewise destined to be displaced, including a multitude of loathsome mixtures and concoctions, such as preparations of vipers and toads, excrement, hog lice, dead creatures, selected parts of animal viscera, dead human beings, etc., etc. In the march of events, the alchemistic complexities of the Middle Ages, such as Van Helmont's "Amulet," Albertus Magnus' "Elixir of Life," the "Elixir Album," "Elixir Rubrum," and a multitude of elixirs of the Disciples of Hermetic Philosophy disappeared, as did also the numberless complex distillates and illogical compounds of mediæval Europe, a few of which, however, have left fragments of their skeletons, reclassified, to cumber our pharmacopœias. As examples of such lingering compounds that came thus to our doors may be cited "Elixir of Vitriol," which gave us aromatic sulphuric acid; "Elixir Salutis," which gave us compound tincture of senna; "Elixir Proprietatis," which gave us compound tincture of aloes; "Elixir Stomachicum," which gave us compound tincture of gentian; "Elixir Sacrum," which gave us tincture of rhubarb and aloes. Taken as a whole, we perceive in the history of pharmaco-medicine a mighty struggle or turmoil through the passing ages, amidst which reason gradually took the place of both fancy and faith, and in which the action of definite drugs replaced charm, superstition, and the attractive mystery of occultism. As a factor, as well as a shadowy actor in it all, is to be seen the growth of:

The Pharmacist.—Not until the 18th century had well passed into history, did the pharmacist appear as a distinct factor in his unhappy struggle for individuality. Into the field where religion, legend, superstition and medicine were commingled, the alchemists, those searchers for the "Alkahest," the "Philosopher's Stone," the "Quinta Essentia," or "Soul of the Four Elements," wedged themselves. Not only were these men destined to serve their parts in the birth of modern chemistry, but in the evolution of the pharmacist as well. Such as Paracelsus, Cagliostro, the healers by vegetables (Galenical pharmacy), the advocates of minerals (remedies originated by fire), each in turn combated for supremacy, while the votaries of sulphur (the "Home of the Spirit"), Mercury (the "connecting link between spirit and body"), the users of animal and vegetable nostrums, the believers in the doctrines of signatures, of charms, of mysticism and astrology, by turns deceived the people, and themselves as well, and racked and tortured humanity. Charlatanism was ever rampant; mystery, deception, fallacy and legend reigned supreme. Fact concerning both remedies and diseases dovetailed so closely into fancy, both of form and expression, as to mystify both the actors and beholders, and to distract the historian. But at last, as a result of this ordeal and struggle, the

physician, freed largely from the realm of mysticism, became a self-existing entity. Yet, for a long period, he served a dual part, for he was both the giver and the maker of medicine, while the surgeon and the barber were still one. Now came a cry for the separation of the art of compounding from the art of prescribing medicine, but it is impossible, in a limited article, to locate with exactness the dates of the varying differentiations, inasmuch as the process has not been a uniform proceeding, so far as either periods or countries are concerned. Different countries moved separately, as indeed did different sections of the same country. Nor do they to-day parallel each other. There have been ebbs and flows in the march of civilization, and to these medicine has ever responded, and yet responds. For example, as early as the time of Aristotle,⁷ the "physician" practised medicine, and the business of the "apothecary" consisted in "preparing and dispensing medicines"; and yet, not until 1754 did the code of the College of Physicians of Edinburg prohibit their Fellows and Licentiates from "keeping an Apothecary Shop." In England, a still greater license prevailed in the selling of medicines, which were not infrequently carried by grocers as a part of their stock, until 1617, when it was by law enacted that "no grocer should keep an apothecary's shop, and no surgeon should sell medicines." Even when the shop of the apothecary finally took a recognized place as a supply for medicine, the apothecary did more or less prescribing. This, proportionately, led to a degree of rivalry and even antagonism between physicians and apothecaries, an antagonism which had come down through the Middle Ages and the 15th, 16th and 17th centuries, lasting even into the 19th century.⁸ Finally, under the inroads of modern science and the higher ethics of the leading professional men of healing, the physician turned his attention more directly to therapy, while the coexisting barber and surgeon separated. Chemistry became a modern science, and pharmacy a recognized art, but one whose limits are even yet undefined, for never has the "apothecary" been regarded merely as a "collector or compounder of drugs."

The latter part of the pharmacist's evolution may be graphically shown by a study of the successive issues of the European pharmacopœias, to which we may briefly allude. The first English pharmacopœia, issued (1618) by the College of Physicians, carried many curious mixtures and many cumbersome, ridiculous compounds. "Theriaca Andromachi," containing 60 ingredients (one of them a preparation of vipers), and other prescriptions of similar complexity held place, even in the revision of 1650. But animal drugs and similar products were gradually relegated to obscurity, and finally, when chemistry became the master of alchemy, and the art of compounding became separate from the art of prescribing, mysticism practically vanished from the field of European pharmacy, leaving a number of pharmacopœias, each bearing modified relics of formulæ that had sifted to them from the past.¹⁰

American Pharmacy.—In the early practice of American medicine, remedies similar to those employed in England naturally prevailed. In our infancy, such works as the Dispensatory of Quincy, and the Dublin and Edinburgh dis-

pensatories were conspicuous authorities. English text-books and English educational institutions, directly or indirectly, schooled the majority of American physicians. From them the professors in the American medical colleges drew their inspiration.* Familiar English compounds, such as Dover's Powder, James' Powder, Fowler's Solution, Elixir of Vitriol, Sweet Spirit of Niter, Hiera Picra, Black Drop, Laudanum, Paregoric, etc., were everywhere in evidence.

Early American pharmaceutical preparations, like the practice of American medicine, were thus but the outcome of the transplanted English art, which, as has been shown, was a conglomerate from out the siftings of mediæval Europe, which in turn had heired the remains of ancient sects and systems. As an example, although sassafras† and sarsaparilla were introduced into the Cordic Dispensatory, in 1592, American remedial agents were not taken seriously, even in America, until long after this date. American medicine, as well as therapy, were, until the opening of the 19th century, in the hands of the physician, who prescribed from his own stock of drugs. There is no evidence that a pharmacist, as now known, existed in America preceding the Revolution. The first American attempt at separating the two factors then vested in the physician, was made by Dr. John Morgan, of Philadelphia, in an address (30 May 1765), for which he was severely criticised for "trying to transplant into a new country, ideas that were suited only to continental practice."¹² Not until 1774 did another physician write a prescription, when Dr. Abraham Chovert of Philadelphia presumed to make the innovation.

No author, no committee, even, ventured to issue an American pharmacopœia before 1778, at which date William Brown published at Lancaster, Pa.,¹³ a little work of 32 pages for the use of the military hospital of Washington's army.‡ This was followed, 1808, by the Pharmacopœia of the Massachusetts Medical Society, and in 1820 by the first edition of the Pharmacopœia of the United States, which has since been revised each decade, although in 1830, owing to a split in the convention, two revisions appeared, one from New York, the other from Philadelphia. See PHARMACOPEIA.

The American Pharmaceutical Association, which met first in 1852, and continuously each year thereafter, excepting 1862, has been of invaluable service in advancing American pharmacy. To its endeavors may be added the influence of the State Pharmaceutical societies and their publications, as well as the many journals on pharmacy. The attention of observing physicians and botanists practising in rural American districts, and others, was finally drawn to the possibilities of the American flora, which was destined, eventually, to contribute its quota of remedial agents. Among the keen observers of that time may be mentioned B. S. Barton, Benjamin Rush, Manasseh Cutler, Wm. Tully, C. S. Rafinesque, Jacob Bigelow, Robley

* The first in America to teach medicine, including materia medica, pharmacy and pharmaceutical chemistry, was Dr. John Morgan, 1765, Philadelphia.

† The first American remedy introduced into Europe, about 1562. First described in detail by the Spanish physician, Monardes, of Sevilla, in 1754.¹¹

‡ The Botanical treatises of Manasseh Cutler, 1785, and Schoepf, 1787, could scarcely be called medical.

Dunglison, Samuel Thomson, Stephen Elliott, Daniel Drake, Wooster Beach, R. E. Griffith, Wm. Zollicoffer, John King and numerous others.

In the first half of the 19th century the Thomsonian and Eclectic schools of medicine arose, whose efforts were conspicuously devoted to the study of American vegetable products and the suppression of cruelty in medication, such as blistering, bleeding, salivation and the use of depleting energetics. In 1821, the Philadelphia College of Pharmacy was instituted, while the New York College of Pharmacy opened in 1829. *The Journal of the Philadelphia College of Pharmacy* (the first journal on pharmacy in the English language), appeared in 1825, and the *American Druggists' Circular* in 1857, to be followed by a number of journals on pharmacy, now current. A power in themselves, great has been their influence.

These separated and often antagonistic factors led to a remarkable interest in American medicines, which was furthered by the rivalries both of the American schools in medicine, and by the sects and factions practising medicine in America, from which must not be excluded those using "Domestic Medicine," as well as the "hydropaths" and the so-called "Indian Doctors." About this period (middle of the 19th century), pharmacists began to give their attention more liberally to remedies that were increasingly American, while simple preparations, equally as effective but more pleasant, were devised to replace the more complex Pharmacopœial mixtures. The "Compound Tinctures" (the elixirs of old), "Compound Powders," etc., were largely displaced by fluid extracts, and simple tinctures, while the great class of foreign confections or conserves, the numerous treacle mixtures, the many electuaries, the distilled waters of herbs and mixtures of herbs, familiar in European Pharmacopœias, also mostly disappeared.

Let us now briefly consider this evolution of medicinal products in its connection with the practice of American medicine, for medicine and pharmacy are inseparable. Until the middle of the 19th century, remedies nasty and violent were not only prevalent, but were prescribed in heroic doses. The public, as well as the medical profession, had been taught to consider desirable drug action as necessarily connected with systemic shock. Pharmaceutical preparations, as well as dosage, were such as usually violated the patient's conception of pleasure, rest and peace. Distasteful decoctions and concoctions, salivating mercurials, violent emetics, blisters and escharotics, bleeding and torturing mechanical processes, were conspicuous. This condition confronted pharmacy when Coxe's *American Dispensatory* appeared (1806), and the first edition of the *Pharmacopœia*, already mentioned (1820). No less was it a factor when appeared in 1833 the first edition of the '*Dispensatory of the United States*,' fashioned like that of Coxe, after the European dispensatories, but yet evidencing a spirit of unrest and independence. Already had arisen in America a growing questioning of such methods of medication, a questioning that was fostered, if not instigated, by the attacks of the irregulars, the faddists, the various curers by secret mixtures, and independent agita-

tors outside the medical profession, who, without much hope of success, and with no systematic plan, demanded reform, both in method and medicine. Their incipient attempt was first a questioning cry, next an energetic plea, then a demand for kindness to the sick. But these alike met the resistance of a body of physicians trained by the authority of centuries in the belief that disease was due to devils, as an invading entity, and that the devil must be fought by fire. The crusade that followed made Wooster Beach (see ECLECTICISM) and Samuel Thomson conspicuous. European drug conglomerates were finally bitterly and publicly assailed, as well as were the generally accepted methods of those who treated disease by such authority as reigned supreme, especially bleeding, blistering and mercurials. Thoughtful physicians likewise became imbued with a desire for new and more kindly agents to take the place of harsh and disagreeable remedies. All this gave both an incentive and an encouragement to pharmacists, and now it was that American substitutes for European remedies, both drugs and pharmaceutical preparations, began to creep into conspicuity. The resultant more elegant pharmaceutical preparations and more direct remedies led also to simplicity of medication, that was fortified by the discovery of a few proximate principles of plants. New processes and new classes of pharmaceutical preparations now began to prevail, on pharmacopœial authority.

As in medicine, so in pharmacy. The reform began in the early part of the 19th century with the application of the process of percolation to powdered drugs, suggested by Count Real in 1815, and adopted by Roullay Brothers, Paris, France, 1837. This process took deep root in America, and owing chiefly to the impetus given the subject by the French pharmacist, Duhamel, in his paper republished in the '*American Journal of Pharmacy*' (1838), and to the efforts of Proctor, Graham, Parish, Squibb, and others, it was adopted in the 1840 *Pharmacopœia*, in making "Fluid Extracts."

This new class of pharmaceutical preparations, the "Fluid Extracts," was a great improvement on the decoctions, infusions and common tinctures then so commonly employed. American manufacturing pharmacists and pharmaceutical factories now for the first time became a factor in pharmacy, and turned their attention to the cultivation of this promising field. By means of special studies, improved appliances, and expert manipulative talent, they accomplished more than could have been expected of the circumscribed apothecary, of endless cares, limited opportunities, and innumerable shop diversions. Factory-made, sugar-coated pills were introduced (followers of French coated *dragées*), and attained a wonderful popularity (1860 to 1880). These were closely followed by gelatine coated pills (known long previously, but nearly forgotten), and under the force of these machine-made products and their numberless combinations, the art of extemporaneous pill-making by prescription, practically disappeared from the realm of the American pharmacist. Then came factory-made, empty, gelatine capsules for encasing powders and masses, and finally, at the close of the 19th century, with a rush, came mechanical tablets of various fancy colors and designs

carrying divided amounts of drugs, and stamped into a variety of pleasing forms. These being advertised to physicians, largely brushed aside the prescription-made powders of the apothecary. Trade emulsions and trademarked specialties also took a place in medication, while elixirs (1860 to 1875) in the way of sweetened and aromatized liquids, arose in numberless combinations to help the manufacturer in his aggressive inroads. The Eclectic School of Medicine felt the touch of the times, and turned its attention to the evolving of remedies more effective and more pleasant than were the very disagreeable early Eclectic products. The first edition of King's 'American Dispensatory' (1852), had been a great factor in correlating and somewhat simplifying Eclectic preparations, after which Scudder's aggressive attacks on the complex (shot-gun processes) in Eclectic medicine, and his plea in behalf of kindlier, more effective and more pleasant remedies, established the reformation. The heroic methods of Samuel Thomson were likewise abandoned by his followers (now known as the Physio-Medical school), until the past harshness of Thomsonian practice contrasts with their present methods, about as favorably as does the evolution in the Eclectic school. Notwithstanding ridicule and sarcasm of the "Regular" medical profession, the pleasant granules and dilutions of Homœopathy found favor with the public, and although of European origin, found a fertile and responsive field in America, serving American pharmacy and medication even more than its disciples appreciate, or its antagonists concede. The inroad of these discordant factors came between 1820 and the century's close. With increasing rapidity they followed each other, and together led to a brushing out of the disagreeable *old*, and its replacement with a more pleasant *new*.

Looking back over this period, one perceives, mainly, the bitterness of rivals and antagonists, the calumnies and attacks of individuals, the contentions of sects in medicine, and of factions in pharmacy. But this discord of the factors was accompanied by a harmonious movement of the whole, in which pharmacy and medicine were slowly uplifted, and by which the people have surely benefited.

The Present in Pharmacy.—Contrasted with half a century ago, the art of pharmacy in America is scarcely to be recognized by either the constituents of physicians' prescriptions, or by classes of pharmaceutical preparations. True, the Pharmacopeia still gives place to tinctures, syrups, pills, decoctions, infusions, etc., while old style bottles still cumber the pharmacists' shelves, but in practice the remedial preparations of the last century are no longer supreme, and many drugs then deemed vital are obsolete. Bitter has been the crusade that resulted in their displacement, a revolution has it been, largely to be credited to the factors that America has evolved and fostered, since she arose to take an active, critical part in the evolution of modern pharmacy.

At present, the evolution of pharmaceutical plant preparations is increasingly teaching that, in their natural settings, they constitute classes of substances that cannot be wholly paralleled by isolated constituents. In their interstructural forms and relationships, plant constituents are,

as a class, colloidal or amorphous. It is now becoming apparent that the science of pharmaceutical chemistry applied to the vegetable kingdom demands the closest investigation of colloidal attributes, and of connected, catalytic affinities. A pronounced feature in alkaloidal problems is the discovery (by John Uri Lloyd), that colloidal hydrous aluminum silicate has a special affinity for all alkaloids. This affinity is considered as an adhesion attraction, the compounds of even the bitter alkaloids, such as strychnine, being tasteless or nearly so. These compounds have the remarkable quality of retaining their integrity in the presence of dilute (aqueous) acids, while dilute alkalies liberate the alkaloids from combination. This fact enables physicians to administer freely alkaloids that, uncombined, would disturb the stomach, because in the acid gastric juice, the alkaloid is inert. As an example may be mentioned the emetic alkaloids of ipecac, chief of which is emetine, that in this combination have no nauseating qualities.

An American "pharmacy" (drug store) now embraces not only medicines, but many foreign substances which permit of profit. The country drug store carries a miscellaneous assortment of nearly every description, even, at times, including groceries, wall paper, paints, glass and oils. In our cities the past 50 years have, as a rule, excluded oils, paints and glass from the pharmacist's province, but have introduced candies, fancy soda beverages, and many similar substances fully as foreign to medicine. Prescriptions are to a less degree than formerly compounded from preparations prepared by the pharmacist, factory-made products being favored by physicians to a great extent, and increasingly. Ready made specialties for the self-cure of disease are becoming familiar to the public, who purchase tablets and pills of active drugs so freely, as increasingly to breed harmful drug habits, a wrong that now receives the urgent attention of lawmakers and philanthropists. The past decade has brought from Germany a number of patented, copyrighted and trademarked synthetics, introduced first to the medical profession, who prescribed them by name. Thus they became known to the laity, who soon became self-prescribers of energetic remedies, such as the hazardous heart depressants, whose employment is not without risk, even under the watchful eye of a physician. This pernicious effect of over-drugging by these substances, as well as by the narcotics of old, has perhaps led an increasing class of citizens to discard all remedies, and to discredit all physicians, their beliefs reminding one of the healers of the far distant past, when the Church cared for both spiritual and temporal ailments. And lastly, may be briefly noted the introduction of animal extracts, anti-toxins and serums, which came at the very close of the 19th century. Within recent years, these animal products have claimed the attention of many physicians, the long established animal digestive agents, pepsin and pancreatin being well-known examples. Prolific sources of supply of such as these are the slaughter-houses of America, from which come an extensive line of crude products, once considered as "offal," but now offered in good faith to manufacturers of pharmaceutical products, for utilization in the direction of serums and vaccines. The following is a list of "ani-

mal glands" recently offered by a reputable packing company: Parathyroid glands, pectoral glands, sheep thyroids, inguinal glands, pre-coral lymph glands, precapular glands, mammary glands, pancreas glands or liver sweetbreads, posterior sublingual, pineal glands, hog ovaries, calf thyroids, stomach linings for pepsin, calf thyroid glands, beef thyroids, suprarenal glands, sheep thymus glands, reto-pharyngeal glands, calf thymus or throat sweetbreads, pituitary glands, beef thymus gland or throat sweetbreads, anterior sublingual, beef ovary glands, hog thyroids, sheep ovaries, "or any other pharmaceutical preparations in our line."

All these conspiring influences together with annoying State pharmacy laws, and the inroads of cut-rate druggists and aggressive department stores, have no doubt harassed the dispensing pharmacist. And yet, the literature of pharmacy to-day is the most extensive in all its record, the latest edition of the *Pharmacopœia* of the United States is superior to anything that has preceded, and pharmaceutical education is the most comprehensive and exacting in all American history.

* * * * *

The author is indebted to the Lloyd Library for the data on which this paper is based. The titles of *Pharmacopœias* and *Materia Medica*s, numbering several hundred, in this collection, need not be given, but it is desirable that a few volumes concerning the historical record be referred to by consecutive text numbers. These are as follows:

1. Peters, H. (Netter's translation), 'Pictorial History of Ancient Pharmacy,' Chicago 1889.
2. Ebers, 'Papyrus Ebers,' Leipzig 1889.
3. 'Laws of Hammurabi,' found in ruins of ancient Susa. The most ancient code of public laws yet discovered, 2250 B.C. (700 years before the time of Moses.) Translated and described in 'Records of the Past,' Washington, D. C., March 1903.
4. 'Charaka-Samhitā' ('Works of Charaka') 775 B.C. Translated into English and published by Avinash Chandra Kaviratna, Calcutta. Still in process of publication.)
5. Wellcome, 'Ancient Cymric Medicine,' London 1903.
6. Wilder, 'History of Medicine,' New Salem, Me., 1901.
7. Watson, 'The Medical Profession of Ancient Times,' New York 1856.
8. Heydon, 'Theomagia or The Temple of Wisdom,' London 1664.
9. Bell and Redwood, 'Progress of Pharmacy,' London 1880.
10. Lloyd Library Collection of *Pharmacopœias*.
11. Lloyd, 'Historical Story of Sassafras,' Chicago 1898.
12. Wilbert, 'Life of John Morgan,' 'Amer. Jour. of Pharm.' 1904.
13. 'Am. Jour. Pharmacy,' Vol. 56, 483-491, 1884; Vol. 63, 156-157, 1891.

JOHN URI LLOYD,

President Lloyd Library, Cincinnati, Ohio.

PHARNACES, fār'na-sēz, king of Pontus, son of Mithridates the Great. He usurped the throne of his father, who was compelled to commit suicide, 63 B.C., and by friendly embassies to Pompey enjoyed for a time the friend-

ship of Rome. The civil war between Cæsar and Pompey tempted him to make an effort to extend his territory, thereby bringing on a war with Rome. For a time he was successful, capturing Colchis and Armenia, but Cæsar himself met him near Zela (47 B.C.), utterly routed his armies, and sent to Rome the famous message, "Veni, vidi, vici." Reports conflict concerning the fate of Pharnaces, some accounts having him slain by his son-in-law, Asander, while others make him die in captivity.

PHAROS, an island off the coast of Egypt opposite Rakotis. The island was connected with the mainland by Alexander the Great, who constructed the famous mole known as the Heptastadium. At the entrance of the greater harbor Ptolemy I engaged Sostratus of Cnidus to erect a great lighthouse, which was brought to completion under Ptolemy Philadelphus. This huge tower had a square base 100 feet to the side and a beacon fire was maintained at the summit. It ranked as one of the wonders of the ancient world but there are evident exaggerations as to its height and other dimensions. On 7 Aug. 1303 this lighthouse, long known as the Pharos of Alexandria, was partially destroyed by an earthquake, and its ruin was completed about 1346. Subsequently the stone was used in the construction of the fort Kaït Bāi. Consult Tübker, 'Reallexikon des klassischen Altertums' (Vol. II, 8th ed., Leipzig 1914).

PHARSALIA, fār-sā'li-ā, the name given to the northernmost section of the great plains of southern Thessaly, whose principal city is Pharsalus (q.v.). The name of the district is sometimes applied to the battle, better known as that of Pharsalus; and served Lucan (q.v.) as the title for his republican epic glorifying Cato and the other opponents of Cæsar, many of whom were killed in that battle.

PHARSALUS, fār-sā'lūs (now FERSALA in Greek; CHATALJA in Turkish), city of southern Thessaly on the Enipeus, south of Larissa. A town of considerable antiquity with fortifications commanding the important defiles of the Othrys, one of the gateways of northern Greece, it played no part in Greek history, but was the scene of a Roman victory over Philip V of Macedon in 196, and in 48 B.C. (9 August, or possibly 6 June), of the complete defeat of Pompey (q.v.) by Julius Cæsar (q.v.), the beginning of the end of republican Rome. In 1881 Pharsalus became a part of Greece through cession, with Thessaly, by the Turks. In the war between Greece and Turkey the Greeks were defeated near this town 5 May 1897, and the Turks occupied it the next day. Since 1900 the city has been the seat of two Roman Catholic sees: Phanarus and Thessaliotides.

PHARYNGITIS, inflammation of the mucous membrane which lines the pharynx (q.v.). See NOSE AND THROAT, DISEASES OF.

PHARYNX, the region included in the back part of the mouth and upper portion of the throat. The pharynx is a funnel-shaped elastic pouch-like passage, about four inches in length, connecting the cavities of the mouth and nose with the œsophagus and the larynx. In repose the pharynx is continuously open for the passage of air to and from the lungs. During the act of swallowing, the pharynx is

closed by its muscular fibres to impel the food toward the stomach. As a whole, it is attached superiorly to the basilar process of the occipital bone. Its broadest part lies opposite the hyoid bone. Its lowest boundary is at the cricoid cartilage of the larynx, that is, about the level of the fifth cervical vertebra, where it passes into and becomes continuous with the narrower œsophagus or "gullet." It is loosely attached behind to the bodies of the cervical vertebrae by areolar tissue destitute of fatty elements.

The pharynx is composed of three coats — the inner being the mucous layer, the middle a fibrous coat, and the outer a muscular layer. The muscular coat is composed of various distinct muscles, chief among which are the three constrictor muscles of each side. The inferior constrictor arises from the sides of the cricoid and thyroid cartilages; the middle constrictor takes origin from the great cornu or horn of the hyoid bone, from the lesser cornu, and from part of the stylo-hyoid ligament; while the superior constrictor, situated at the upper part of the pharynx, arises from the hamular process of the sphenoid bone. All of these muscles are inserted into the middle line of the pharynx. The stylo-pharyngeal muscle of each side arises from the inner aspect of the base of the styloid process. The constrictor muscles of the pharynx contract upon food and cause it to pass downward to the œsophagus, the action of the stylo-pharyngeal muscles being to draw the sides of the pharynx outward and upward and so to widen the cavity for the reception of food from the base of the tongue. The pharynx forms only part of the mechanism connected with swallowing the tongue and the palate (q.v.) and its arches and muscles being also intimately concerned in the process. The pharynx is also concerned in the modulation of the voice.

The pharynx is commonly considered as of two general parts: The nasal, or nasopharynx — that part above the plane of the soft palate; and the oral, or oropharynx — that part below the soft palate. Some anatomists divide the oropharynx into a middle section to which they limit that name, and the laryngopharynx, the section lying next to the larynx.

Seven apertures open into the pharynx: The two Eustachian tubes of the ear; the two posterior nares or hinder openings of the nostrils; the single aperture opening backward from the mouth, termed the isthmus facium; the cordiform or heart-shaped opening of the larynx, guarded by the epiglottis; and the opening of the œsophagus, into which the pharynx itself is continued. See ADENOIDS; ALIMENTARY SYSTEM; BRAIN; DIGESTION; NOSE AND THROAT.

PHASCOLOGALE, fās-kō-lō gā-lē, or "pouched mouse," a genus of small marsupials, differing from the dasyures in their dentition, which is on the insectivorous order; found throughout Australia, New Guinea and the Aru Islands. They bear some resemblance to rats, but are usually much smaller. The muzzle is long and pointed, and the ears are somewhat rounded and nearly naked. The pouch is rudimentary, rarely more than a fold in the skin below the teats which range from 4 to 10 in number. The latter fact would indicate that they produce more young at a birth than any other marsupial. The hind feet have five toes

and generally are broad with smooth soles. They feed on insects, and climb trees (except *P. virginia* of North Queensland) in order to get them. *P. penicillata*, or Tapoa Tafa, is one of the commonest species, and is a pretty little animal with a bushy tail. The four Papuan varieties are marked with a stripe. See DASYURE.

PHASE. See ELECTRICAL TERMS.

PHASE, or **PHASIS**, in astronomy, one of the appearances noted as to the illumination of the moon in its passing from an unilluminated state (dark moon) through that of a continually broadening crescent and gibbous stages to a complete orb (full moon), and back to a dark moon again. (See MOON). Similar phases are undergone by the planets whose orbits lie between that of the earth and the sun. Mars, though his orbit lies outside the earth's orbit, exhibits slight phases; when in opposition his disk is circular, at all other times it is gibbous. Saturn's rings, also, show limited phases.

PHASIS, fās'sis, in ancient geography, a navigable river of Colchis, 305 miles in length, rising in the mountains of Armenia, and forming a part of the boundary line between Colchis and Asia Minor. It is now called Rioni or Rion (q.v.), after one of its tributaries, the Rhion of antiquity. Near it pheasants were plentiful and their name, *Phasianus colchicus*, is derived from that of the river, *Phasian* in Latin meaning "belonging to the Phasis."

PHASMIDÆ, or "spectre insects," "leaf insects," and "walking sticks," a family of orthopterous insects allied to the *Mantidæ*, and remarkable for their very close resemblance to the leaves, twigs, grass and lichen-covered bark in the midst of which they live. The family includes about 600 species, nearly all being natives of tropical and semi-tropical Asia, Africa and Australia. Only six genera are represented in the United States and only one species, *Diapheroma femorata*, in the eastern section. The others are to be found only in the south and southwest. They are all vegetable feeders in which they differ from the *Mantidæ*. Some of them are destitute of wings, and have the appearance of dead twigs, while the motionless attitudes they assume add to the deception. In others, as the genus *Phyllium*, the wings have the appearance of withered leaves, while the brighter hue of the wing-covers of a few of larger size give to the animal the appearance of a fresher leaf. An interesting peculiarity of these insects is their ability to reproduce a lost limb in the succeeding molt, provided the joint next the body was not severed. See LEAF-INSECT; MIMICRY IN ANIMALS; WALKING-STICK INSECT.

PHEASANT, the common appellation of a group of magnificent gallinaceous birds generally considered to constitute a family (*Phasianidæ*). There are 20 genera included, with over 100 species. The name is an Anglicized form of the Latin *Phasianus*. The upper mandible is arched, overhangs the lower at the tip, and is naked at its base; the nostrils are placed at the base of the mandible, and are covered by a scale. The cheeks, region about the eyes, and often other parts of the head are naked and often provided with fleshy outgrowths.

The wings are short; the tail long, wedge-shaped, and consisting of 18 to 32 feathers, but with its coverts often presenting a remarkable development. The three front toes are united by a membrane up to the first joint, and the hinder toe is articulated to the tarsus. The males possess horny tarsal spurs. The food consists of grains, soft herbage, roots and insects. Pheasants are chiefly terrestrial in habits, taking short, rapid flights when alarmed. They are polygamous, the males and females consorting promiscuously together during the breeding-time, which occurs in spring. The simple nest is commonly formed amid long grass or bushes, and the female performs the entire duties of incubation. No true pheasants are indigenous to America, but all of the genera and species belong to Asia and are particularly represented in India and Indo-China. The English ring-necked pheasant, which is a familiar bird in this country, having been introduced into pheasantries and preserves, is a hybrid between the ring-necked pheasant (*Phasianus torquatus*), imported from China about a century ago, and *P. colchicus*, which is supposed to have been brought to Great Britain by the Romans, but may have been native. This pheasant is found throughout southern Europe, and was known to the ancient Greeks and Romans; Jason is reported to have brought it from Colchis in the famous ship *Argo*. The English pheasant often has also blood of *P. versicolor* and the plumage varies accordingly.

These birds breed freely in a domesticated state. The pheasant will interbreed with the common fowl, the Guinea fowl, and even with the black grouse; and there are white and pied varieties of the common species. The hybrid produced by the union of a cock-pheasant with the common hen is termed a *pero*. The female pheasants when old may, like pea-fowl, assume the feathers and general plumage of the males.

The pheasant is a famous game-bird in England and parts of the Continent. Great numbers are reared and fed artificially, and liberated in selected coverts on English estates. Considerable numbers have been placed on preserves in certain parts of the United States; but, while these handsome birds undoubtedly add interest to the landscape, pheasant shooting cannot be commended as a sport; the birds are too tame. As practised in England it differs little from a slaughter of barnyard fowls.

The green pheasant of Japan (*P. versicolor*) and the copper pheasant of China (*P. soemmeringi*) have also been introduced into the United States. Many of the Asiatic species of pheasants, the males of which exhibit strikingly handsome colors or peculiar modifications of the plumage, are well-known objects in aviaries and fancy-poultry yards in this country. The golden pheasant (*Chrysolophus pictus*) of eastern Tibet and southern China is a beautiful species, colored scarlet, blue, black and yellow, and having a brilliant golden erectile crest borne on the head. The Lady Amherst pheasant (*C. Amherstiae*) is one of the most brilliant and among the largest, reaching 50 inches in length and exhibiting golden yellow, orange, blue, russet and crimson shades. It succeeds well in confinement. The silver pheasant of Indo-China and the lower Himalayas (*Gennaes nycthemerus*) belongs to the Kalij (kaleege) group. It possesses a generally silver-white

plumage, the feathers being marked by fine concentric black lines; the under parts are colored black. The tragopan or "horned" pheasant (*Tragopan satyra*), found in the Himalayas, approaches more nearly the domestic barnyard fowls. The males of this species possess peculiar bluish, fleshy, horn-like processes on the head, and wattles of a similar color. The male plumage is colored red with white spots, that of the females being brown. The habitat of the tragopan is the high Himalayan forests, from 7,000 to 12,000 feet elevation. The argus pheasant (*Argusianus argus*), included by some naturalists with the peacocks (*Pavoninae*), is a large species found in Sumatra and the Indo-Malayan region. The males of this bird measure from five to six feet from the tip of the beak to the extremity of the tail. The plumage is exceedingly beautiful, the secondary quills of the wings being each adorned with a series of ocellated or eye-like spots of brilliant metallic hues. The general body plumage is colored brown. The flight is feeble, owing to the length of the secondary feathers, which latter, however, assist these birds in running. A bird of somewhat similar eye-spots found over the same region is the peacock pheasant (*Polyplectron*).

Reinhardt's argus pheasant (*Reinhardtius ocellatus*) also belongs in this group, and is the largest of the pheasants, being 84 inches in length; of which the tail measures 60 inches. The Blood pheasant (*Ithaginis*) is a native of Tibet inhabiting even higher elevations than the Tragopan—from 10,000 to 14,000 feet altitudes. The male has bright grass-green plumage; the female, brown. The Eared pheasant (*Crossoptilon*) is another species of the high Himalayas. It readily becomes extremely tame, and promises to be one of the best for domestication. The Cheer pheasant is another Himalayan species frequenting the lower levels. Its colors are less striking but elegant—buff, barred with black and pale blue. Reeves' pheasant, a native of central Asia, is a very large bird, 75 inches in length, with a long white tail barred with black. It has been naturalized in English coverts, and also tested in the United States. It is regarded as the "gamest" of all the pheasants, flying readily and with great swiftness. Other pheasants often found in aviaries are the Firebacks (*Lophura*) of Cochinchina and Malaysia, and the Koklass pheasant (*Pucrasia*) from the mountain region of Afghanistan. The gorgeous Impeyan pheasant or Moonal (*Lophophorus impeyanus*) is found in South Kashmir. This, and related species of the same genus inhabiting the Himalayas, are of surpassing beauty, with their crested heads and brilliant metallic greens, purples, golden and coppery colors, set off by patches of silvery white and velvety black. The Jungle Fowl (*Gallus*), from which our domestic fowls are doubtless descended, is a member of the pheasant group. So also is the Pea-fowl (q. v.). In parts of the United States the ruffed grouse is erroneously known under the name of "pheasant." The turkeys belong to a family closely related to the pheasants, which they represent in the native avifauna of America.

The first successful introduction of pheasants into the United States was in 1880-81 by Hon. O. N. Denny, then consul-general at

Shanghai, China. He selected the native ring-necked pheasants and in two importations succeeded in landing alive 22 cocks and 20 hens. These birds were liberated in the Willamette Valley, in Oregon, and prospered exceedingly. In 1892 an open season of 10 weeks was declared, and it was reported that the first day's shooting netted 50,000 birds. This experience aroused a demand from all parts of the country for breeding stock, and pheasantries multiplied throughout Oregon. In 1899 alone shipments of breeding birds were made to 509 different localities, from Alaska to Mexico. The greater part of these experiments failed utterly, but the birds have flourished in Oregon, Washington and British Columbia. Consult Barton, F. T., 'Pheasants in Covert and Aviary' (London 1912); Elliott, D. G., 'Monograph of the Phasianidae' (2 vols., New York 1872); Tegetmeier, W. B., 'Pheasants: their Natural History and Management' (London 1897); United States Department of Agriculture, 'Farmers' Bulletin 390' (Washington 1910).

J. PERCY MOORE,
University of Pennsylvania.

PHEASANT'S EYE, a popular name for the garden Adonis flower (*Adonis aestivalis*). It is also used as a distinctive name for a particular group of hardy pinks. See PINKS.

PHÈDRE, fâ'dr' (Phædra 1677) was the last tragedy written for public performance by Jean Racine and shows his dramatic method in its highest development. He gave it the first place among his tragedies. Boileau agreed with him. Votaire thought Phædra's rôle "the finest ever put on the stage in any language." Yet its immediate success was bitterly contested, as that of some of his other plays had already been, by a court cabal directed by the Duchess de Bouillon. Pradon's insignificant ('Phèdre et Hippolyte') was set up against it. There was a lively war of sonnets, too, in which Racine's friend Boileau had the better part. Old scandals were revamped, and matters grew so embittered that only the intervention of Condé saved Racine from prosecution on a trumped-up charge of corruption of public morals. With the subsidence of personal piques and passions ('Phèdre') was recognized as a masterpiece and has engaged the talent of a long series of great actresses to this day. The theme is that of the exquisite ('Hippolytus') of Euripides and the declamatory ('Phædra,' or 'Hippolytus,' of Seneca. Comparison well illustrates the Greek and the Roman practice in tragedy and the French classical tradition. But in 'Phèdre,' as in no other French drama, the analysis of passion is so wrought as to produce not merely Aristotle's purgation by moral fear but also by psychic terror at the victims' powerlessness to contend against what she knows to be sin, against 'Venus clinging utterly to her prey' (line 306). Racine thus wholly changes the ethical bearings of the situation. He brings into it a Christian conviction and something of the peculiarly Jansenist theory of the powerlessness of the human will without prevenient divine grace, which was then deeply engaging his interest and that of Church and court in France. This gives to his treatment of the characters in the play a distinct modernity. Greek feelings and ideas are so deftly mingled with the modern that this heroine of ancient legend seems, in

Chateaubriand's phrase, "the sinner fallen alive into the hands of God," to be pitied, though inexcusable.

Phædra, young bride of the aging Theseus, who has left her at Troezen, finds herself truly sick of love for his son Hippolytus, votary of the chaste huntress Diana and cold to her advances. Her "shameful grief" is thus further inflamed. She knows it to be criminal, but finds no power in herself to resist "all the furies of love" which drag her, the woman scorned, through desire of death and fear for her good name, to frantic resolve of jealous vengeance. Calumniating the son to the father, she leads Theseus to will and effect the death of Hippolytus, whose strange fate is recounted in the famous *récit de Theramène*, a stock declamation piece in France (lines 1498-1570). Phædra in terrified remorse confesses her fault. Her guilty confidante Oenone "has found in the sea too mild an expiation." She "exposing her penitence to all, will go down to the dead by a slower way," and ends her life by a poison of Medea's brewing.

Phèdre is edited with English Comments by Bué (London 1903), and Babbitt (Boston 1910); with French comments by Mesnard in 'Oeuvres de J. Racine' (Vol. III, 1865) and by Clouard in 'Théâtre complet de Racine' (Vol. III, 1912). Translated as 'Phædra' by Boswell in 'Dramatic Works of Racine' (London 1890), by Tickell and others. Consult Deltour, 'Les Ennemis de Racine' (pp. 331-368, Paris 1859).

BENJAMIN W. WELLS.

PHELAN, James Duval, American legislator: b. San Francisco, 20 April 1861. In 1881 he was graduated at Saint Ignatius College and studied law at the University of California. He was a commissioner and a vice-president of the World's Columbian Commission and after the San Francisco disaster of 1906 was president of the Relief and Red Cross funds; was designated by President Roosevelt to receive funds and was member of the committee of 50 and 40 for relief and reconstruction. He erected the largest office building in San Francisco after the fire. In 1896-1902 Mr. Phelan was mayor of San Francisco and in 1900 received a complimentary vote for United States senator in the California legislature. In 1913 President Wilson appointed him special commissioner to Europe to support his invitation to foreign countries to participate in the Panama-Pacific Exposition of 1915, and was also special commissioner to investigate the diplomatic complications arising in Santo Domingo in 1915. In 1914 he was elected to the United States Senate for the term 1915-21.

PHELAN, Richard, American Roman Catholic bishop: b. near Ballyragget, County Kilkenny, Ireland, 1 Jan. 1828; d. Idlewood, Pa., 20 Dec. 1904. He was educated in the College of Saint Kieran, Kilkenny; came to this country in 1850 attending first the old seminary of Saint Michaels, and subsequently spending three years in Saint Mary's Theological Seminary at Baltimore. Ordained to the priesthood in 1855 he was for four years a curate at Saint Paul's Cathedral at Pittsburgh, after which he served as pastor at Freeport, Pa., until 1868, when he was appointed pastor of Saint Peter's Church, Allegheny City. A new church which

he built there at a cost of \$150,000, regarded as perhaps the finest in Western Pennsylvania, was destroyed by fire just as Father Phelan was leaving for a new and higher appointment. He relinquished his elevation and remained with the charge until a new church had replaced the ruins of the former building. He served the diocese several times as administrator and in 1883 was made vicar-general. In 1885 he was consecrated coadjutor bishop of the two sees of Allegheny and Pittsburgh, succeeding to the full bishopric of Pittsburgh in December 1889.

PHELPS, Anson Greene, American merchant and philanthropist; b. Simsbury, Conn., 12 March 1781; d. New York, 30 Nov. 1853. He was by trade a saddler and at 18 established himself in business at Hartford, Conn., afterward owning a branch business at Charleston, S. C. In 1815 he removed to New York where he formed a partnership with Elisha Peck under the title of Phelps and Peck, dealing in tin plate and heavy metals. This house became the largest house in the metal trade in the United States. By the later addition of Mr. William E. Dodge, a recruit from the dry goods trade, the world famous house of Phelps, Dodge and Company was established. In 1845, Mr. Phelps bought a dam and surrounding lands on the Naugatuck River, Connecticut, and built a factory and some dwelling-houses; thus founding the town of Ansonia which was named for him. Out of this concern grew the great Ansonia Brass and Copper Company. Mr. Phelps amassed a large fortune, which was augmented by fortunate investments in real estate. His later years were spent in benevolent enterprises; he was president of the American Board of Commissioners for Foreign Missions; of the New York Asylum for the Blind; the Seaman's Friend Society; the Seamen's Bank for Savings; the American Tract Society, and the New York branch of the Colonization Society. His will bequeathed large sums to religious and charitable institutions.

PHELPS, Austin, American Congregational clergyman and author; b. West Brookfield, Mass., 7 Jan. 1820; d. Bar Harbor, Me., 13 Oct. 1890. He entered Hobart College, and after two years there went to Amherst and thence to the University of Pennsylvania where he was graduated at the head of his class in 1837. He studied theology first at the Union Theological Seminary in New York and later at the Yale Theological School; but having begun to preach, he was persistently urged before his course was completed to accept a pastorate. He continued his study, however, until 1842 when he accepted a call to the Pine Street Congregational Church, Boston. He remained pastor of this church until 1848 when he resigned to accept the chair of Homiletics and Sacred Rhetoric in Andover Theological Seminary. His health failing he resigned his professorship in 1879. He had also been president of the institution from 1869. The rest of his life was spent in retirement. His published works include 'The Still Hour' (1859), a book which was reprinted in many thousands abroad; 'The New Birth' (1867); 'Studies of the Old Testament' (1879); 'Theory and Practice of Preaching,' a much valued work (1881); 'Men and Books' (1882); 'English Style in Public Discourse' (1883); 'My Studies and Other Es-

says' (1886); 'My Note Book: Fragmentary Studies in Theology and Subjects Adjacent Thereto' (1889). He was, besides, a constant contributor to 'The Congregationalist,' and other religious periodicals. (See also PHELPS, ELIZABETH STUART). Consult 'Austin Phelps: A Memoir,' by Elizabeth Stuart Phelps-Ward (New York 1891).

PHELPS, Charles Edward, American soldier and jurist; b. Guilford, Vt., 1 May 1833; d. Baltimore, Md., 26 Dec. 1908. He was graduated from Princeton in 1852, from Harvard Law School in 1853, and established a law practice in Baltimore, Md. He was one of the founders of the Maryland Guard, serving, first as captain and later as major. In 1862 he entered the Federal service as lieutenant-colonel in the 7th Maryland Volunteers, and was soon made colonel. He commanded a division of the Fifth Army Corps at Laurel Hill, where he was severely wounded. He was promoted to the rank of brevet brigadier-general of volunteers and was awarded a medal of honor for gallantry at the battles of the Wilderness and Spottsylvania. He was elected to Congress in 1864 and 1866, and in 1882 elected to the Supreme bench, Baltimore, for a 15-year term. Re-elected in 1897 for a like term, a special act of the legislature in 1902 permitting him to continue in office, though past the constitutional age limit. He was professor of law at the University of Maryland and wrote 'Phelps's Juridical Equity' (1894) and 'Falstaff and Equity' (1901).

PHELPS, Edward John, American diplomatist; b. Middlebury, Vt., 11 July 1822; d. New Haven, Conn., 9 March 1900. He was graduated at Middlebury College in 1840, and took up the study of law in the office of Horatio Seymour at Utica, finishing with a year at the Yale Law School; was admitted to the Vermont bar in 1843, and began practice at Middlebury, but in 1845 settled in Burlington, Vt. In 1851 he was appointed second comptroller of the treasury by President Fillmore and remained in the office through his administration. He was strongly opposed to the Civil War, was a member of the Vermont constitutional convention in 1870, and in 1881 was president of the American Bar Association, and in that year ran for governor of Vermont on the Democratic ticket but was defeated. In 1881 he was made Kent professor of law in the Yale Law School and also lecturer on constitutional law in Boston University. President Cleveland appointed him Minister to England 1885-89. In 1890 he was the Democratic candidate for United States senator in the Vermont legislature but failed of election. During the Bering Sea dispute in 1893 he was appointed by President Harrison senior counsel for the United States, after which he resumed his chair at Yale and continued there until his death. He wrote 'The Life and Character of Charles Linsley'; 'Orations and Essays' (published posthumously 1901), and a series of articles on the Constitution of the United States published in the *Nineteenth Century* in 1888.

PHELPS, Elizabeth Stuart ("H. TRUSTA"); American author; b. Andover, Mass., 13 Aug. 1815; d. Boston, Mass., 30 Nov. 1852. She was married to Austin Phelps (q.v.) in 1842 and subsequently devoted much attention to writing.

Her 'Sunny Side' (1851) reached a sale of over 100,000 in one year. Among her other works are the 'Kitty Brown' series (1850); 'The Angel over the Right Shoulder' (1851); 'A Peep at Number Five' (1851); 'The Tell-Tale' (1852); 'Little Mary' (1853), and 'The Last Sheaf from Sunny Side' (published with a memorial by her husband 1853).

PHELPS, Elizabeth Stuart. See **WARD, ELIZABETH STUART PHELPS.**

PHELPS, John Wolcott, American soldier and abolitionist: b. Guilford Centre, Vt., 13 Nov. 1813; d. Brattleboro, Vt., 2 Feb. 1885. His progenitors for several generations were eminent lawyers. He was graduated at West Point in 1836; entered the artillery and served against the Creeks and Seminoles, 1836-38. After this war he was in charge of the removal of the Cherokee Indians to the West. In the Mexican War he fought at Monterey, Vera Cruz, Cerro Gordo, Contreras, Molino del Rey, and City of Mexico, and was brevetted captain for gallant conduct, but declined a nominal promotion, and in 1850 received the regular promotion to that rank. He served along the Mexican border until 1852 when he went to Europe on a year's furlough. On his return he served under General Johnson in the Utah expedition. He resigned from the army in 1859, and devoted himself to writing vigorous and scholarly articles attacking the principle and practice of slavery. He enlisted in 1861 as colonel of the 1st Vermont Volunteers, was soon made brigadier-general, and was with Farragut in the lower Mississippi in April 1862. He occupied New Orleans 1 May 1862, and issued soon after a proclamation against slavery, which resulted in a reproof from General Butler. During his command of Camp Parapet, near New Orleans, the camp was thronged with escaped slaves and General Phelps began organizing them as troops. The government was not yet ready to accept this policy, and General Phelps was sharply rebuked, and ordered to use the negroes only for menial labor, the argument presented being that they were still slaves, and that slaves could not be soldiers. In August 1862 he was declared an outlaw by the Confederate government for having "organized and armed negro slaves." Failing to make headway against continual opposition, he resigned and returned to Vermont. A few months later the government adopted his view, and began to organize negro regiments, and President Lincoln tendered him a commission as major-general in command of such troops. This, however, he declined. In Vermont he took a prominent part in educational work and in historical research, and was an eminent anti-Mason. He was nominated for the Presidency by the American (or Anti-Masonic) party in 1880. He opposed all secret societies, and in 1864 translated de la Hodde's 'Sociétés secrètes de France' under the title 'The Cradle of Rebellions.' He also wrote 'Sibylline Leaves' (1858); 'Secret Societies, Ancient and Modern' (1873); 'History of Madagascar' (1884), and contributed extensively to literary and scientific periodicals of the day. Consult biographical sketch by Howard, C. H. C. (Brattleboro, Vt., 1887).

PHELPS, Oliver, American merchant and land speculator: b. Windsor, Conn., 1749; d. Canandaigua, N. Y., 21 Feb. 1809. He was a

merchant in Suffield, Conn., and from 1771 in Granville, Mass., and amassed a large fortune. In 1788 he formed a partnership with Nathaniel Gorham and purchased from the Commonwealth of Massachusetts its pre-emptive rights to a tract of 6,000,000 acres of land in New York for £300,000, to be paid for in "consolidated securities." The land was within the charter limits of both New York and Massachusetts, but a compromise was effected whereby the sovereignty remained with New York and the ownership of the territory was ceded to Massachusetts by the Hartford convention of 1786. Phelps secured the Indian title to 2,600,000 acres of the land and opened at Canandaigua the first land office in the country. The rise in value of the "consolidated securities" made full payment impossible and Phelps relinquished to the State the portion of the land still unpaid for. In 1790 he sold to Robert Morris his remaining share, 2,100,000 acres, and in 1795, in partnership with several others, purchased from Connecticut 3,300,000 acres in Ohio, known as the Western Reserve. Later he sold his interest and returned to Canandaigua. He was the first judge of the county of Ontario, and was a member of Congress in 1803-05. He took an active interest in the Erie Canal and the Welland Canal, and for a time engaged in building steamboats on Cayuga Lake.

PHELPS, Samuel, English actor: b. Devonport, Devonshire, 13 Feb. 1804; d. near Epping, Essex, England, 6 Nov. 1878. He was employed as junior reader in the office of the *Plymouth Herald*, and later on the *London Globe and Sun*. For some time he belonged to a private amateur theatrical society of which Douglas Jerrold and William Edward Love were also members. In 1825 he made his public début as an amateur at the Olympic Theatre, later joining a circuit in which he achieved popular success. In 1837 he made his first appearance in London, in the character of Shylock, at the Haymarket Theatre and scored a success, appearing later in the same season with Macready in Covent Garden Theatre, alternating with him the rôles of Othello and Iago. He came rapidly to the front as an actor, rivaling Charles Kean in many Shakespearian roles. In partnership with Thomas Greenwood and Mrs. Warner he took the management of Sadler's Wells Theatre, Islington, in 1844, and there achieved a great success, extending over 20 years, and producing more than 30 of the plays of Shakespeare and other famous dramatists. He published an edition of Shakespeare in 1853. Consult Coleman, J., 'Memoirs of Phelps' (London 1886); Forbes-Robertson, J., 'Life and Life-Work of Phelps' (London 1886).

PHELPS, Thomas Stowell, American naval officer: b. Buckfield, Me., 2 Nov. 1822; d. New York, 10 Jan. 1901. He was graduated from the United States Naval Academy in 1846, served in the Mexican War, was engaged in the coast survey, and participated in the Indian War in Washington Territory in 1855-56. In 1858-59 he served on the Paraguay expedition as master, and later as lieutenant, and at the outbreak of the Civil War was in command of the coast survey steamer *Vixen*, engaged in making surveys of southern harbors. He joined the naval expedition for the relief of Fort Sumter and was actively employed in making the needed war charts of southern

ivers and inlets, taking part in many skirmishes while carrying on his work. In 1862 he joined the North Atlantic squadron and participated in the Peninsula Campaign (q.v.). He was commissioned lieutenant-commander and took a creditable part in many engagements. In 1863 he was made commander of the *Corwin* and resumed the work of making charts for campaign purposes. In 1864 he distinguished himself at Fort Fisher, where he commanded the *Juanita*. He afterward served on the southern coast until 1867, when he was transferred to the California navy yard. In 1871 he was promoted to the rank of captain, and in 1879 to commodore. In 1881-82 he was commandant of the Mare Island navy yard and in 1883-84 commanded the South Atlantic squadron. In 1884 he was made rear-admiral and was retired in that year, after 45 years of active service. He published 'Sailing Directions for the Straits of Magellan' (1855); and 'Reminiscences of Washington Territory' (1882).

PHELPS, William Lyon, American educator: b. New Haven, Conn., 2 Jan. 1865. He was graduated from Yale in 1887 and is now professor of English literature there. He is the author of 'The Beginnings of the English Romantic Movement' (1893); 'The Permanent Contribution of the 19th Century to English Literature' (1901); 'A Dash at the Pole' (1909); 'Essays on Modern Novelists' (1910); 'Essays on Russian Novelists' (1911); 'Teaching in School and College' (1812); 'Essays on Books' (1914); 'Browning, How to Know Him' (1915); 'The Advance of the English Novel' (1916); 'Archibald Marshall' (1918). He has also edited many editions of English classical authors. He is vice-president of the National Institute of Arts and Letters, member of the Authors Club, London, and president of the New Haven Symphony Orchestra. Mr. Phelps is also a well-known lecturer on literary subjects.

PHELPS, William Walter, American statesman and diplomat: b. New York, 24 Aug. 1839; d. Teaneck, N. J., 16 June 1894. He was graduated from Yale in 1860 and from the Columbia Law School in 1863, engaged in an extensive law practice as counsel for a number of banks and trust companies, and nine railroad companies. Upon the death of his father he withdrew from his general law practice and devoted his energies to the management of some large estates and the trusts connected with them. In 1872 he was elected member of Congress from New Jersey on the Republican ticket, and took an active part in the proceedings of that body, particularly on monetary questions. He was appointed Minister to Austria in 1881, resigned in the following year, and in 1882-88 was again in Congress for three consecutive terms. In 1889 he was one of three United States commissioners to the International Conference on the Samoan question, held in Berlin, and in 1889-93 was United States Minister to Berlin. In the latter year he was appointed judge of the New Jersey Court of Errors and Appeals, which office he resigned on account of failing health a few weeks before his death.

PHENACETIN, fě-năs'ě-tin, in pharmacy, $C_6H_5O.C_6H_4.NH.COCH_3$, para-acet-phenetidin (acetphenetidin in the United States Pharma-

copœia) is formed by the action of the strongest acetic acid on para-phenetidin, a body related to both aniline and phenetol. When crystallized from a water solution phenacetin forms colorless crystalline scales, odorless, tasteless, sparingly soluble in cold water, more so in hot water or alcohol. It has found extensive use as an antipyretic and an analgesic, being one of the least dangerous and most efficient drugs of its kind. It is a heart depressant, diminishing the action of the cardiac muscle. Frequently combined with caffeine when used for relief of headache, neuralgia, the pains of rheumatism, and the like. See ANALGESICS; ANTIPYRETICS.

PHENACITE, a transparent mineral, not unlike quartz, for which it may be easily mistaken, usually colorless, but sometimes tinted yellowish or wine-red. It possesses extraordinary hardness, 7.5 to 7.8, and yields gems of much brilliancy. It occurs in prismatic crystals often very large, up to one pound or more in weight, and also in lenticular form in Russia and Switzerland, also in the United States, with topaz at Topaz Butte (near Florissant), and on Mount Antero, Colorado. In lenticular form it is found with topaz on Bald Face Mountain near Chatham in New Hampshire, and in the mica mines of Amelia County, Virginia. It is a beryllium orthosilicate, with the symbol Be_2SiO_4 or $2 BeO.SiO_2$ and the average composition: silica 54.45 per cent and glucina 45.55 per cent.

PHENACODUS, or **PHENACODON**, a typical perissodactylic representative of the early extinct, ungulate group *Condylarthra* (q.v.), whose well-preserved remains are recovered from the lowest strata of the Lower Eocene (Wasatch) formations of the central Rocky Mountain region. Two species are known — *P. primævus*, about as large as a tapir and *P. wortmanni*, smaller — that is, from five to six feet in length. The head was comparatively small and the brain-cavity relatively so and the brain itself small and smooth, the cerebellum uncovered and as large as the cerebrum. The halves of the lower jaw are not fused at the chin; the dentition is generalized; clavicles are absent; the hind limbs are much larger than the fore limbs and the feet are nearly plantigrade and five-toed. The terminal phalanges of the toes show that they did not bear claws but hoofs, with the axis passing through the third digit, foreshadowing the condition of the single-hoofed animals (horses). Consult Woodward J., 'Vertebrate Palæontology' (London 1898); Beddard, F. E., 'Mammalia' (London 1902).

PHENOL, or **CARBOLIC ACID**, C_6H_5OH , is the first member of a series of hydroxy compounds in which the hydroxyl group is directly attached to the nucleus. It was discovered by Runge in coal-tar, in 1834. The commercial product is obtained from this source by fractional distillation. The fraction containing carboic acid is shaken with sufficient sodium hydroxide solution to form sodium phenate, which yields phenol when treated with carbon dioxide in the presence of a small quantity of sulphuric acid. For the manufacture of certain compounds, i.e., picric acid and for medicinal purposes, phenol is prepared synthetically by fusing dry sodium benzene sulphonate with caustic potash. The

product is cooled, dissolved in water and acidified with HCl , H_2SO_4 or carbonic acid. Another synthetic process consists in the treatment of acidified aniline sulphate solution with the required quantity of sodium nitrite. The diazonium salt obtained in this reaction yields phenol when heated with water. The products in all these processes may be purified by distillation. Phenol has also been obtained by the distillation of crystallized salicylic acid, and by heating molecular proportions of chlorobenzene, sodium hydroxide and water to about 300°C . under pressure.

Phenol crystallizes in needles or prisms, melts at 42°C . and boils at 183°C . It is very soluble in glycerine, alcohol, ether, chloroform, benzene and to a limited extent in water, one part of phenol dissolving in 15 parts of water at 16°C .; the solubility increases with rise of temperature. The crystals of phenol are hygroscopic and liquefy in the presence of moisture. Under the influence of light or air the compound assumes a red color. According to recent investigations this is caused by minute traces of quinone or its derivatives. Chemically pure phenol has practically no action upon blue litmus paper, the red color imparted to blue litmus by phenol from coal-tar is evidently due to benzoic acid. The hydroxides of strong alkalis, halogens, nitric acid, sulphuric acid and other reagents readily react with phenol forming a number of derivatives.

Phenol finds wide application as a powerful antiseptic. Disinfecting powders or liquids contain a mixture of the compound with neutral substances like infusorial earth, tar-oil, etc. In the concentrated form phenol is a powerful irritant, coagulating albumin, destroying the mucous membrane and gradually paralyzing the higher tissues. Taken internally it acts as a fatal poison. Phenol is used on an extensive scale for the manufacture of picric acid, salicylic acid, phenacetin, phenolphthalein and other derivatives. It is an important intermediate in the dye industry; with benzotrichloride it forms benzaurine, with oxalic and sulphuric acids it condenses into coralline, with diazo-sulphanilic acid it is converted into Tropaeolin Y and with meta- and para-diamines it forms derivatives from which black dyes of the aniline-black series are obtained. The important commercial article, known as Bakelite, is manufactured by the condensation of Phenol with formaldehyde in the presence of a base. When this product is molded into the desired form and heated under pressure in the presence of a filling material like asbestos, rubber, casein, nitrocellulose, etc., it becomes insoluble, hard and sometimes infusible. Buttons, umbrella handles, insulators, tobacco pipes and many useful articles of commerce are manufactured from Bakelite. See also CARBOLIC ACID.

V. S. BABASINIAN,

Professor of Chemistry, Lihigh University.

PHENOL, Poisoning by. See TOXICOLOGY.

PHENYL, a monovalent radical with the symbol C_6H_5 , entering into the composition of many organic substances, as benzene (phenylhydride); phenol (phenylhydroxyl); aniline (phenylamine), etc. It exists in the free state in diphenyl, in the combination $\text{C}_6\text{H}_5 - \text{H}_5\text{C}_6$,

PHERÆ, fēr'ē, one of the most ancient cities of southeastern Thessaly, in the Pelasgiotis. It was situated in a fertile region and was surrounded by gardens and plantations and was 10 miles westerly from its harbor city of Pagasæ; both towns were intimately connected with the myth of Alcestis (q.v.) and Admetus, the son of Pheres, the founder of Pheræ and father of Emmelus who sailed with 11 ships from Pheræ and neighboring towns to take part in the Trojan War. In the early years of the 4th century B.C., toward the close of the Peloponnesian War, in which Pheræ had aided the Athenians, a tyranny was established here by Lycophron, whose son Jason succeeded him, became the practical master of all northern Greece and thus the forerunner of Philip and Alexander of Macedon and was assassinated in B.C. 374, by his brothers. They quarreled quickly; Polyphron killed Polydorus and was himself assassinated by his nephew Alexander in 369, who is remembered for his fiendish cruelties. But his reign was short; about 359 his wife Thebe and her brothers killed him. The government was continued by two of the brothers, Tisiphonus and Lycophron, successively. The latter was deposed by Philip of Macedon, who, after an unsuccessful experiment with democratic government at Pheræ, made it a part of the province of Thessaly. The ruins of Pheræ may still be traced near the modern town of Velestino.

PHERECYDES, fēr-ē-sī'dēz, early Greek philosopher, probably belonging to the middle of the 6th century B.C. He was a native of the island of Syros (and is not to be confused with Pherecydes of Leros, 485-400 B.C., an Athenian historian, of whose works only fragments remain). His philosophy shows the influence of the Phœnicians and probably had an admixture also of the Egyptian and possibly included the doctrine of metempsychosis, or transmigration of souls. His great work, entitled 'Heptamychus' or 'Pentemychus,' a cosmogony based on the three elemental energies of Time, Earth and Æther; a curious blending of science and mythology. Cicero says that Pherecydes was the first Greek to teach the immortality of the soul. Pythagoras was his pupil, but it has not been established that the theory of the transmigration of souls, propounded by the latter, was a part of the philosophy of Pherecydes. Philo Judæus is reckoned among his followers. The few remains of his writing, in the Old Ionic dialect, are edited in Müller, K. O., 'Fragmenta Historicorum Græcorum' (Göttingen 1850); and the recently discovered 'Marriage of Zeus and Chthonia' in Grenfell, B. P., 'New Classical Fragments' (Oxford 1897).

PHI BETA KAPPA SOCIETY. See GREEK-LETTER SOCIETIES AND COLLEGE FRATERNITIES.

PHIDIAS, fid'i-as, Greek sculptor: b. Athens, B.C. 498; d. there, B.C. 432; the age of Pericles. He was the son of Charmides, and a pupil of Hegias the Athenian and probably of Ageladas, the sculptor of Argos. He was first employed on public works by Cimon (q.v.) under whom he executed several statues at Delphi. The works of himself and his pupils were exceedingly numerous, and he is said to have executed three important statues of Mi-

nerva or Athene alone, all of which were standing in the time of Pausanias (175 A.D.). One colossal statue, "Athene Promachos," that is, the champion, was of bronze, the metal for which was taken from the spoils of Marathon. It stood between the Parthenon and the Propylæum. Upon her shield, in rilievo, was wrought the battle of the Centaurs, from designs by Parrhasius. Near the statue stood an owl, the bird of Athene, goddess of wisdom. This statue towered so high on the Acropolis that mariners, doubling the promontory of Sunium, saw her helmet and her spear. The second of his most famous statues was made of ivory and gold. It was the Athene of the Parthenon or the temple of Parthenos, the virgin goddess, and was about 41½ English feet in height. This was the renowned chrysele-phantine statue, formed of wood overlaid with ivory. The arms were of gold, as was the peplos or garment, and the metal was either beaten or cast with such exquisite skill that this robe might be put off or on, and could be weighed by the treasurer of the temple. Thus the sculptor was enabled to refute the charge of peculation afterward made against him, and foreseen by Pericles who warned him to devise the removable garments. The gold weighed 44 talents. The eyes were of marble, painted according to the Homeric description of the blue-eyed goddess. The figure stood upright, ægis on breast and spear in hand. A serpent or dragon stood near it, supposed to be that of Erichonius, one of the gods of the hill. In the right hand of the goddess was the figure of Victory, of ivory, with a vestment of gold, four cubits high. By her side stood the shield; on the convex side of which was carved the battle of the Titans. Phidias is said to have introduced portraits of himself and of Pericles in the Battle of the Amazons, one of the subjects carved upon this shield. The Olympian Zeus of Phidias was ranked for its majestic beauty among the wonders of the world. It was nearly 60 feet in height, including the throne and was regarded as the greatest of Greek sculptures. Zeus was here seen sitting upon a throne, with an olive wreath of gold about his temples; the upper part of his body was naked; a wide mantle covering the rest of it, hung down in folds to his feet, which rested on a footstool. The naked parts of the statue were of ivory, the dress was of beaten gold. In the right hand stood Victory facing the statue, and carved, like it, out of ivory and gold; she was holding out, as if offering to the deity a fillet of triumph. In his left hand Zeus held a sceptre, made of various metals skilfully joined, and on the sceptre an eagle had alighted. Power, wisdom and goodness were admirably expressed in his features. Cicero relates that the artist was led by a passage in the Iliad to conceive such a figure. The statue was surrounded and concealed by hanging tapestry, which was drawn aside only on particular occasions. This statue was removed to Constantinople by Theodosius I, and destroyed by fire in 475.

Phidias was, moreover, employed by Pericles as an architect, and by his genius Athens was made the most magnificent city in Greece. During the government of Pericles, which lasted 20 years, it was adorned with more temples, colonnades and works of art than Rome could

boast the construction of in seven centuries. Materials and artists were abundant. Phidias superintended these improvements; and the sculptures with which the Acropolis was adorned were partly from his own hand and partly worked out by pupils in the spirit and after the ideas of this great master. While a number of existing statues are attributed to him none can be identified as positively of his own handiwork. The frieze of the Parthenon, of which only fragments remain, is generally regarded as his personal work. Phidias received great honors from the Athenians, but was subsequently accused first of peculation, which he successfully disproved; and then of impiety for putting his own likeness and that of Pericles on the shield of Athena. He died in prison, a martyr to his friendship with Pericles, on whom his persecutors aimed by this action to inflict suffering.

Consult Collignon, M., 'Phidias' (Paris 1886); Gardner, E. A., 'Six Greek Sculptors' (London 1910); Lechat, H., 'Phidias et la Sculpture Grecque au Ve Siècle' (Paris 1906); Mueller, K. O., 'Commentatio de Phidiae Vita et Operibus' (Göttingen 1827); Murray, A. S., 'History of Greek Sculpture' (London 1890); Waldstein, C., 'Art of Phidias' (Cambridge 1885):

PHIGALIAN (fī-gā'li-an) **MARBLES**, a frieze from the temple of Apollo Epicurius at Bassæ, four miles from Phigalia in Arcadia, rediscovered by Bochor and by Chandler in 1765, when the temple was practically intact, having been nearly hidden by the vegetation of the mountain slopes below which it lies. The temple was unique in that its orientation was north and south, instead of east and west, and in that its frieze was on the inner walls of the cella, a circumstance which preserved it from weathering. The frieze comprised 23 marble blocks cut in high bas-relief, each two feet two and one-half inches high and forming complete a length of over 100 feet. It was purchased by the British government in 1814 for £15,000 and is now in the British Museum. Although the original design was evidently excellent, the workmanship shows many evidences of hasty execution at the hands of several different workmen. The subjects of the carvings were the battles of the Lapithæ and the Centaurs, and between the Amazons and the Greeks. The restoration of the temple, a Doric building, 125 by 46 feet, of yellowish limestone, has been undertaken by the Greek Archaeological Society. Consult Cockerell, C. R., 'The Temples of Jupiter Panhellenius at Ægina and Apollo Epicurius at Bassæ' (London 1860), and Smith, A. H., 'Catalogue of the Sculptures in the Department of Greek and Roman Antiquities, British Museum' (London 1892).

PHILADELPHIA. See ALA-SHEHR.

PHILADELPHIA, Pa., the largest city in the State and the third largest in the United States, at the junction of the Delaware and Schuylkill rivers (Independence Hall, lat. 39° 56' 57.5" N., and long. 75° 8' 54.75" W.). The site was determined by the "Falls line," which marks the limit to inland navigation on the Schuylkill and to navigation by deep-sea craft on the Delaware. Both sociological and natural causes combined to establish a centre of population between the Hudson and Chesapeake Bay

on the peninsula, partly alluvial and partly glacial drift, whereon Philadelphia arose, 96 miles from the Atlantic and about the same distance from New York and Baltimore.

Topography.—The city's area (84,933.12 acres, whereof 1,593 acres is water surface or 132.7 square miles in all) is an irregular figure. Its curving eastern boundary is formed by the Delaware. The southern limit is a line east and west following narrow watercourses which separate League Island and Hog Island from the municipality. Its western and northern limits are Delaware, Montgomery and Bucks counties and are defined by the early colonial administrative lines fixed by proprietary grants. Cobbs and Darby creeks divide off Delaware County on the southwest and Poquessing Creek marks the extreme northeastern limit. Within this area there are three fairly defined regions. The first is the low, flat peninsula between the rivers, from 8.7 to 40 feet above mean low tide. The second region is bounded to the south by a 40-foot contour line, whose southern angle reaches to Broad and Callowhill streets, and rises over on a strike of azoic schists and gneisses (Bush Hill), which extends from the Schuylkill to the Delaware. This region runs to the north, with lower ground near the Delaware, culminating in the northwest in Chestnut Hill, 431 feet high, and other elevations of like height. The third region is west of the Schuylkill (West Philadelphia), a rolling country 200 feet high in Fairmount Park and 100 feet in the built-over sections. The old city was laid out on the peninsula from river to river; the factory section grew up in the second region, with Germantown on the heights, while West Philadelphia began as an open suburb and still is mainly a residential district. Three lesser streams crossing the municipal area originate outside the city limits. The Wissahickon, draining an upland plain in Montgomery County, has cut a canyon-like valley through primitive rocks and enters the Schuylkill at Manayunk, furnishing a remarkable park feature. Across northeastern Philadelphia, which remains in great part open country, the Pennypack and Tacony flow, both draining the plateau to the north of the city. Within the built-over sections the drainage is by parallel streams entering the Delaware and rising in the elevated region in the northwest of the city, the most important being Wingohocking Creek and Gunners' Run. These parallel streams have been made the basis of a sewage system, which has nearly everywhere a fall of from 20 to 40 feet. The easy grades and the absence of restraining physical features have led to the spread of population and habitations in all directions. Settlements started at favorable points, as Germantown on the fertile and sunny southern slopes toward Chestnut Hill; or they grew up around mill, shipyard and furnace and were gradually enveloped by the greater community. Philadelphia's amœba-like growth resembles that of London rather than the organic extension of Paris or New York.

City Plan.—Philadelphia was the first of modern municipalities whose plan was prepared for a particular site. Captain Thomas Holme, surveyor-general for Pennsylvania, whose name has survived in that of the village of Holmesburg on Pennsylvania Creek, made

the lay-out in the form of a parallelogram, 10,922 feet 5 inches east and west and 5,370 feet 8 inches north and south, extending from river to river and from Vine street to Cedar (now South) street, comprising two square miles. In this area two streets, Broad and High (now Market) were laid out at right angles, 6 perches wide. The other main streets were laid out 3 perches (50 feet) and the alleys $1\frac{1}{2}$ perch (25 feet) wide. The main streets defined squares of about 400 feet to a side, containing 4 acres each and bisected by alleys. The plan gave 30 per cent of the area to street surface, twice the usual proportion in European cities of the day, and the two main arteries were twice the width of the broadest street provided for in London. Broad street is now 113 and Market street 110 feet wide. This rectangular plan has been extended over the entire area and has guided city planning in America ever since. It was followed by Randall in the lay-out of New York and, by reducing realty to lots of uniform size, it has rendered the transfer of property easy and certain. On the original plan the streets running north and south were numbered, as they still are; those running east and west were named after trees, the botanical vocabulary having since been supplemented by a wider nomenclature. At irregular intervals avenues 100 feet wide have been added, some of these running diagonally. A system of numbering, under which the century changes for every block, makes the house number a co-ordinate and fixes the place of any lot in the city system. Modern ideas of city planning took root late in Philadelphia. Some 20 years ago it was proposed to give more direct access to the northeast from the centre of the city by cutting 100-foot-wide extensions of Kensington and Frankford avenues through to Broad street; the proposals, however, received little official or public support. The Parkway project, conceived about the same time, was not taken in hand energetically until 1909, but has now been carried almost to completion. Beginning with a width of 150 feet, which increases to 250 feet, this magnificent avenue runs from the city hall to Fairmount Park, where it leads through a plaza of 2,000 feet lateral extension to the Municipal Art Museum and where it connects with Fairmount Park drives east and west of the Schuylkill. The building sites on the line of the Parkway have been reserved for the municipal auditorium, the free public library and other structures of a public or semi-public character. The Northeastern boulevard, 300 feet wide and running a distance of seven miles from Hunting Park to Pennypack Creek, is also practically complete. It will form a part of the national Lincoln highway. Besides these 20 other avenues, most of them 148 feet wide, with double or triple roadways separated by planting spaces for trees, shrubs and grass, have been confirmed on the city map. The total length of the park boulevards and avenues thus plotted is 150,240 feet and considerably more than one-half of them are open. The Schuylkill embankments (approved, but stayed by war exigencies) are second to the Parkway alone as city embellishments. The Delaware waterfront improvements are utilitarian in character, though ornamental also in their own way. The foundation of the plan is the widen-

ing of Delaware avenue from 150 to 250 feet its entire length (17 miles). The work has been completed on the whole of the old commercial front, with concrete inner bulkheads and nine municipal and about 30 other piers that may be rated as modern. The plan includes the elevation of all railroad freight lines passing through populated territory to the waterfront, with belt-line connections for all piers; the establishment in the extreme south of the city of a freight terminal covering 600 acres and connecting with 10 railroad and nine municipal piers, each about 1,000 feet in length. The city has \$13,000,000 immediately available to carry out its part of the work. One double-deck pier has been completed by the city and the Federal government is constructing three others for an oversea shipping depot, which will cost \$15,000,000. The revised map of South Philadelphia, showing these improvements with League Island Park, etc., is a good example of modern city planning. Scarcely of less utilitarian value than the Delaware street widening is the Central Traffic Circuit—a parallelogram of 50-foot streets, in the heart of the city to be broadened to 140 feet and connected by radial avenues with the northeast, northwest, southwest and the river front. The projected bridge across the Delaware River is nearing realization.

Housing and Public Works.—About one-half the city area is built over, the unimproved property being mainly in the northeast, where a large proportion is still rated and assessed as farm land. The buildings increase on the average about 6,000 yearly, though the number has risen in some years to 11,000. Of this yearly increase all but a few hundreds are small dwellings, costing normally about \$3,000 each. The number of buildings in Philadelphia at the last count was 443,566, of which 373,608 were dwellings, two-thirds of the latter being two-story brick houses, and 125,000 owned by the people who live in them. In the newly-developed regions the monotony of rows upon rows of such dwellings, unrelieved by a single distinguishing feature, is being broken by arrangement between the building operators and the city. The new houses are grouped around "garden streets" or "neighborhood centres," the builders dedicating the ground and the city providing for the planting or other beautification of the same. There are in all the city 1,703 $\frac{1}{4}$ miles of highways, whereof 1,164 $\frac{1}{2}$ miles are paved city streets, nearly half of them covered with sheet asphalt, 358 $\frac{3}{4}$ miles with granite block, 182 $\frac{1}{2}$ miles with vitrified brick, 43 miles with wood, asphalt, slag or cement and granolithic blocks and less than 10 miles with cobbles or rubble. Of the country roads, 250 $\frac{1}{2}$ miles are paved with water-bound macadam, 105 $\frac{1}{2}$ with bituminous or cement concrete and 182 $\frac{1}{4}$ miles are unsurfaced (earth) roads. In the pavement of newly-opened, primary and secondary thoroughfares (118 and 88 feet wide, respectively) an elastic system has been adopted. Beyond the permanent curb lines temporary curbs are laid down, narrowing the roadway to be paved. In the wider streets the middle of the road is also left unsurfaced, to be planted, like the spaces along the temporary curbs, with trees, shrubs and grass until such a time as increasing traffic requires the use of the roadway to its full width. This effects a

great saving in the initial cost of the pavement as well as in the upkeep. Meanwhile these temporary and, possibly, permanent garden streets are much increased in value and desirability for residential purposes. The 23 sewerage districts with over 1,000 miles of main and branch sewers (there were only 238 miles in 1883) follow in general the drainage basins of the ancient watercourses and are calculated to dispose of a rainfall whose maxima and minima run from 23 to 67 inches annually. Surface drainage for household waste water still prevails in many of the back alleys of the older parts of the city, and the number of houses not directly connected with the sewers was, until recently, quite large. This nuisance, however, is being abated. In four recent years nearly 40,000 privy vaults were abandoned. The Fairmount waterworks were put in operation as a steam-pumping plant in 1815. After 1822 the pumping was mainly by water power, which had meanwhile been installed. The distributing reservoir was completed in 1837 and the Fairmount works, where the water "pumped itself," became one of the engineering wonders in America. The growth of population necessitated an increased supply and other pumping stations were established successively at Roxborough, Belmont and Queen Lane, all of which drew from the Schuylkill. The Frankford station was the only one on the Delaware and supplied only a small percentage of the total consumed. The contamination of the rivers by sewage led to unsanitary conditions which made the name of Philadelphia a byword. Typhoid fever became endemic. The deaths averaged 611 annually for the five years 1898-1902 and were 948 in 1899, with some 12,000 cases. It was decided in 1902 to purify the water supply by slow sand filtration, and on 1 March 1909 the entire city received filtered water. The filters have a nominal daily capacity of 382,000,000 gallons, and two-thirds of the city water is now drawn from the Delaware, the filter beds of the new pumping station at Torresdale having a daily capacity of 240,000,000 gallons. The installation cost of the system was over \$26,000,000. High pressure services for fire protection have also been established in the congested business centre and in the mill district. The necessity of changing the method of sewage disposal was enforced by the health laws of the State as well as by local self-interest, which does not comport with the pollution of the water supply. The plan adopted involves the diversion of the sewage from the streams by three systems of collecting mains to treatment works located, one in the northeast, one in the southeast and the third and largest in the southwest of the city, where the solids will be screened out and digested, and the effluent oxidized by spring filters and made innocuous. The estimated cost of the entire system is \$22,400,000; annual cost of operation \$500,000 and \$2,000,000 a year will be required for new sewers to keep up with the city's growth. The construction of the northeastern system of collectors and Imhoff tanks is well under way.

Government.—Penn granted the first city charter in 1701, on the model of Bristol, which followed English precedents by establishing a body corporate of mayor, council and freemen of the liberties. This charter was superseded

by the act of assembly 11 March 1789, which created a city government with an elective mayor (two-year term), a select council (one member elected from each ward for three years) and a common council (one member for every 2,000 taxpayers in a ward). The mayor's chief function was the charge of the police. Other administrative bodies were created by subsequent legislation: health board, park commission, park wardens, selected by common pleas judges; guardians of the poor, chosen by the councils, whose committees conducted most of the executive administration of the city. The Act of 1854, whereby the city was made coterminous with the county, 13 townships being absorbed, made little change in the form of government. In 1885 the "Bullitt Bill" was passed, embodying the present city charter. This extended the mayor's term to four years and greatly enlarged his powers, giving him the appointment of nearly all city officials. It consolidated the numerous municipal bureaus in departments under single heads, called directors. These are:

The director of public safety, whose department comprises the electrical bureau, the bureaus of police, fire, building inspection, etc., the director of supplies; the director of public works, whose department includes the bureau of city property (city markets, public buildings, parks and squares); the bureau of highways (paving, street cleaning, city bridges); the bureau of surveys (street openings, sewers, city planning); the director of public health and charities, whose department administers the almshouses, hospitals and city farms and includes a housing division; the director of wharves, docks and ferries, in charge of the water front improvement, and whose department in conjunction with the commissioners of navigation (a State board) has charge of the local administration of the port of Philadelphia; the director of city transit, whose department (organized 1 July 1913) is in charge of the planning and construction of a city-owned system of high-speed transit lines.

Other bodies appointed by the mayor having important administrative or advisory functions are the civil service commission; the recreation commission, in charge of public playgrounds; the permanent committee on comprehensive plans, which includes in its membership the mayor and the heads of the engineering departments and bureaus, advises and co-operates in the projection and advancement of public improvements; the art jury, passes on the design and location of all buildings, bridges, arches or other structures and of sculptures or other works of art to be presented to or paid for by the city or other public authority, or for which the city or other public authority is to provide a site, and the zoning commission, empowered to draft a building code, restrict the height, character, use and location of buildings to be constructed or altered, and to prescribe and define residential, manufacturing and other areas.

The departments of education, parks, taxation and city trusts (Girard estate) remain under boards and commissions appointed by the judges of the Courts of Common Pleas. The controller, city treasurer, receiver of taxes and city solicitor are elected by popular vote. The city government is organized on what is called

by municipal researchers the federal plan; the authority of the executive officers to raise and expend money for municipal purposes being granted by the legislative branch, which, in Philadelphia, consists of a select and common council. These bodies sit and vote separately; but in practice the financial program is arranged by a joint finance committee, from the recommendations of department chiefs and in co-operation with the controller, the two chambers of councils ordinarily confining themselves to confirmation of the budget and the tax rate thus agreed upon. Loans may be authorized by ordinances of the council when their total does not exceed 2 per cent of the assessed value of taxable property; when this is exceeded ratification of the ordinance by popular vote is required. Franchises for the operation of public utilities must be obtained from the councils. The municipal gasworks are operated by the United Gas Improvement Company under a lease, the city receiving in lieu of rent 20 per cent of all collections from consumers. There is very little other original legislation by the legislative branch of the city government. The department of health prescribes the sanitary ordinances; the board of surveyors in the department of public works makes and revises the street, sewer and water supply systems; the zoning commission is authorized to frame the building code; the art jury and other administrative bodies exercise powers which are legislative in effect. Of course where money is required the departmental and other rulings and plans cannot be carried out unless the funds are provided—and the purpose of expenditures must be stated in the ordinances of councils and have received their approval. The substitution of a small single-chambered city council for the present unwieldy bicameral legislative body of 200 members is a desideratum. The police force of the city consists of 2,500 patrolmen, 300 mounted men and a cycle corps of 50. The traffic regulations are very good. An ambulance service has been organized in conjunction with the hospitals, one of the latter covering each of the 37 ambulance districts. The fire department has 1,037 men and is equipped with 50 steamers, eight chemical engines, 20 hook and ladder trucks, two water towers and one fire boat.

Municipal Finances.—The assessment of real estate for taxes in 1918 was \$1,766,553,000. The rate was \$1.75 per hundred for the general tax (an increase of 25 cents above previous years) and 60 cents per hundred (an increase of 10 cents) for the school tax. The revenue receipts of the city (exclusive of the school tax) for 1917, the last year of which there are complete returns, amounted to \$40,050,418, of which more than one-half, or \$20,148,273, was yielded by the real estate general tax. The departmental expenditures for 1917 were \$40,223,130. The financial statements of the *City Manual* are not well arranged. A better view may be obtained in the 'Financial Statistics of Cities' published by the United States Census Bureau. These relate to the year ended 30 June 1916, but no essential or fundamental changes in the fiscal administration of Philadelphia have occurred since then. The total revenue receipts of the municipality in that year were \$36,195,193, of which \$18,607,117 came from general property tax; \$2,146,137 from business (chiefly

liquor) licenses; \$1,142,173 from special assessments; 256,380 from State subventions; \$1,972,-781 from departmental earnings (of which \$405,-658 and \$243,028 received in fees by the courts and the register of deeds, respectively, were the largest items); \$628,549 for highway privileges from public service corporations; \$4,301,709 for rents (including \$2,784,213, 20 per cent, receipts from consumers of the United Gas Improvement Company); \$1,657,258 for interest, on current deposits, sinking fund and public trust funds); \$5,142,128 in earnings of public utilities — almost entirely from the bureau of water supply. The governmental cost payments amounted in total to \$41,317,229, distributed as follows: Departmental expenditures \$23,988,-582 (which included \$1,668,046 for the administration of justice, \$4,532,835 for police, and \$1,453,967 for fire protection, \$1,194,066 for the financial departments, including the assessment and collection of taxes, and \$668,181 for elections); expenditures in public service enterprises \$2,202,134 (nearly all in the water supply service); \$4,616,534 interest on the funded debt, and \$10,509,979 for departmental outlays. The principal outlays were: for the first pavement and repair of streets and roads, \$3,646,932, a part of which is recouped in the form of special assessments; for sewers and sewage disposal \$1,828,903; for public charities \$527,308; for recreation (playgrounds, public baths, etc.), \$1,095,398; for material and supplies in the water bureau \$1,028,567. The receipts and expenditures of any year rarely balance, the discrepancy being covered by the surplus carried over from the preceding year, and it is often necessary to resort to temporary loans to convert a bookkeeping credit into actual cash. Under the headings "non-revenue receipts" and "non-governmental cost payments" the Census Bureau includes moneys received from the sale of bonds and investments, moneys paid in the purchase of investments and the redemption of obligations and debits and credits representing transfers between the municipality and its independent departments. The following financial statement covers the receipts and payments for 1916 of the city as well as the school district and poor district of Philadelphia:

Cash balance at beginning of year.....	\$16,679,332
Revenue receipts.....	45,858,425
Non-revenue receipts.....	24,756,097
Total.....	\$87,293,854
Governmental cost payments.....	\$52,734,967
Non-governmental cost payments.....	23,441,617
Total.....	\$76,176,584
Cash balance at end of year.....	\$11,117,270

History.—The original site of Philadelphia was occupied by Delaware Indians peaceful and industrious, tributary to the Iroquois. Though the 17th century Swedes and Dutch made a number of settlements on the Delaware River and Bay, most of them abortive, of which the only permanent monument is Gloria Dei (the Old Swedes Church) erected in 1700 on the site of a former Swedish fort. Some 368 Swedes and Dutch and over 800 newly arrived English immigrants (mostly Quakers) were in and about future Philadelphia, when in 1681 Penn obtained his charter as proprietor. The "Letitia" house (now removed to Fairmount Park), which

was built by Penn for his town residence, was occupied by the Provincial Council as its official home during the proprietor's absence. The municipal council remained homeless until in 1709 the Towne Hall, a combined market and courthouse, was built opposite the original Friends' Meeting House, in the centre of High street between Second and Third streets, giving that thoroughfare its new name. Until the State House (Independence Hall) was erected in 1735, the Towne Hall was also the frequent meeting place of the general assembly. From its balcony war was proclaimed against Spain 14 April 1740 and later on George Whitefield, the evangelist, addressed his 6,000 or more hearers. The city grew with great rapidity and became the grain and lumber mart of the Atlantic Coast. In 1725 it was overbuilt and passed through its first reaction. The recovery was rapid, however. In 1725 the vessels arrived and cleared from the port numbered 140; in 1735 there were 427. In 1728 the naturalist Bartram built his house and established his world-famed botanical garden on the west bank of the lower Schuylkill. The house has been preserved and the garden is now a city park. The building of Christ Church was completed in 1744. For 40 years in the middle of the 18th century Franklin was the dominant figure, founding the American Philosophic Society, Philadelphia Library, University of Pennsylvania and Pennsylvania Hospital. The first two of these institutions were direct outgrowths of the "Junto," a literary club organized before 1730, which, through various mutations, led to the committee of safety, whereby the city was governed through the Revolution. "Nothing I ever gained by cunning gave me so much pleasure," wrote Franklin, alluding to the charter of the Pennsylvania Hospital granted in 1751. The original building fronting on Pine street and extending the whole length of the square between Eighth and Ninth streets is still in service. In the way of amusements early Philadelphians had little choice. Bull-bating remained popular until 1820, when Mayor Wharton confiscated the last bull to appear in a Philadelphia ring. The ordinance against play-acting notwithstanding, the old Southwark Theatre from 1760 enjoyed a precarious existence. It was finally opened, under a license, with the performance of Beaumarchais' 'Eugenie,' given in honor of General Washington on his return, a victor, from Yorktown. Peace brought a rapid expansion of population and commerce, checked somewhat by yellow fever, which had frequently visited the city during the preceding 50 years but came with exceptional severity during the last decade of the 18th century, when it twice ravaged a most filthy city. During the epidemic of 1793 an army of people (17,000) camped in open fields or took refuge in neighboring towns. The scourge claimed 5,000 victims, one-sixth of the entire population. The first organized bank in the United States was established at Philadelphia in 1780 by an unchartered association. This became the Bank of North America, planned by Robert Morris with the approval of Congress and incorporated by the Pennsylvania legislature in 1782. The city suffered another commercial setback early in the 19th century in consequence of the Embargo, which was accentuated by the loss of trade and bank failures attend-

ing the War of 1812. The second Bank of the United States, incorporated by act of Congress 10 April 1816, was located in Philadelphia, and on the expiration of its 20-year charter was reorganized as a State bank under the same name. By the year 1820 the city had once more begun to grow. Many charitable institutions, asylums for the blind, the deaf and dumb, the city almshouses, etc., were founded. Girard College was founded and its building commenced in 1833. The decade 1837-47 was a period of disaster, culminating in the failure of the Bank of the United States. Canal and railroad connections with the anthracite coal fields aided in the development of manufactures, and from 1850 Philadelphia led all other American cities in the aggregate value of its products. This industrial growth reached its apex in 1876 and was visualized in the Centennial Exhibition, which was attended by 9,910,966 visitors. A depression ensued and when the city emerged from this in 1879-80 it was to begin a new period of development. The quality of its textile products greatly improved. Cramp, ships; Baldwin, locomotives; Dobson, carpets; Stetson, hats, and eight other industrial establishments were at the close of the 19th century the largest in their lines known anywhere.

Population.—Early estimates of the population of Philadelphia partake of the dubiousness attaching to all colonial statistics. In 1683 the city proper was estimated to have 80 houses and 500 inhabitants. It quadrupled in a year, and in 1699 a rude census showed 4,500 inhabitants. In 1740 the population was estimated at 20,000. A count of houses (4,474) made in 1772 indicates a population of 26,844, and another house census in 1777, showing 5,743 dwellings, indicates a population of 35,000. Exact statistics began in 1790 with the first Federal census. In the following table the population of the city proper and of the city and county combined are shown side by side up to the date of the census of 1850. After that the figures rubricated under the heading "City" show the entire population of the city and county, which had been consolidated:

	City	City and county
1790.....	28,522	54,391
1800.....	41,220	81,009
1810.....	53,722	111,210
1820.....	63,802	137,087
1830.....	80,462	188,797
1840.....	93,665	258,037
1850.....	121,376	408,462
1860.....	565,529	
1870.....	674,022	
1880.....	847,170	
1890.....	1,046,964	
1900.....	1,293,697	
1910.....	1,549,008	
1920.....	1,823,779	

Down to 1820 the city and county of Philadelphia was greater in population than New York, though the population of the city proper was smaller. In 1830 and 1840 the city was exceeded by New York and Baltimore, and in 1850 by New York, Baltimore and Boston. After the consolidation Philadelphia became and remained the second city until the census of 1890, when it became, as it still is, the third city in the Union. The early population of Philadelphia had a larger proportion of non-English (Germans, French Huguenots and Swedes) than any colonial city, New York soon losing its preponderance of Dutch. The racial conglom-

eration has continued, though an unusually large proportion of Philadelphia's population is native-born. No other large Northern city has so large a proportion (63 per cent) born in its own State and the ratio of foreign-born is smaller only in Baltimore and Saint Louis. But the persons of foreign parentage constitute more than one-half, 55 per cent. Less than one-fourth (24 per cent) are of native birth and native parentage. The foreign-born constitute 22 per cent of the total and about one-third are of Irish, one-fourth of German and one-eighth of English birth. In number the colored population is larger than in any other Northern city; but it is only 5 per cent of the total, whereas it was 10 per cent a century ago. Statistics on a basis of municipal boundaries often give an inadequate idea of the population grouped about an urban centre. In the immediate vicinity of Philadelphia there live 583,455 people who form as truly a part of the metropolitan community as those who live in the city proper. The census of 1920 shows a population of 2,407,234 in the metropolitan district of Philadelphia, which includes Chester, Darby, Norristown and Bristol, Pa., and Camden, Gloucester and Burlington, N. J. According to the last Federal census, the population of Philadelphia increased 19.7 per cent between 1900 and 1910 and 17.7 per cent between 1910 and 1920. The increase in some of the nearby cities was much greater. Chester, for example, increased 50.6 per cent in 1910-20.

Industry.—Industry has grown commensurately with the population. A consolidation of manufactures began when the number of establishments, which had risen from 8,461 in 1880 to 18,166 in 1890, diminished to 8,381 in 1910. Capital, which had not increased between 1870 and 1890, had quadrupled by 1910, reaching the total of \$688,782,000. In 1914 capital invested in 8,454 industrial establishments amounted to \$772,696,000. Since then the industrial development has been tremendous. The present capital investment is estimated at \$1,000,000,000 and the annual industrial output at more than that in value. The greatest single increase has been in the shipbuilding industry. The yard of the American International Shipbuilding Corporation at Hog Island is the largest in the world. It has 50 ways; its equipment includes 70 locomotive cranes, 650 electric motors and 80 miles of standard railroad track; approximately 35,000 workmen are employed and the weekly payroll exceeds \$1,000,000. Nearly 100,000 people are engaged in the shipbuilding industry within the Philadelphia zone. In rolling mill, foundry and machine shop output Philadelphia maintains its pre-eminence in quantity, though the product of some American cities may exceed it in value. The Baldwin works are still the largest producers in the country of locomotives; the Pencoyd Iron Works, now employed mainly in government service, built the bridge across the Nile below Khartoum and the Quebec bridge across the Saint Lawrence, the greatest cantilever span ever conceived and carried to completion. The product of the rolling mills, foundries and machine shop industries at date of the last census was valued at \$50,474,000 a year. Other metal industries were brass and bronze, worth \$4,057,000 of output; copper, tin and sheet iron wares, \$7,493,000; cutlery, \$1,686,000; files, \$1,540,000; electrical

machinery, \$7,065,000. The Disston saw works at Tacony are the largest of their kind in the world. The textile products of Philadelphia were: woollens and worsteds, \$54,922,000 (first in the United States); hosiery and knit goods, \$23,971,000; cotton goods, \$22,538,000; carpets and rugs, \$22,629,000. Tanned leather was produced of the value of \$23,526,000; boots and shoes, \$6,517,000; belting, saddlery and other leather goods, \$3,994,000. Other industries in which the city stands in the first rank are: cordage and twine; dyeing and finishing; felt hats (of which 25,000 are produced per day); chemicals (\$9,643,000 per annum); medical compounds (\$9,423,000 per annum); soap (\$7,319,000); paint and varnish (\$8,045,000); lumber and planing mill products (\$7,703,000); tobacco and cigars (\$13,429,000); confectionery (\$7,315,000); fertilizer (\$4,268,000); women's clothing (\$30,133,000), and millinery and lace (\$5,052,000). There has been a great diversion of the industries from their ordinary employment to war work, but the quantity and value of their product as a whole has increased by more than 50 per cent above the figures given. Philadelphia refines 500,000 tons of raw sugar annually, one-sixth of the United States total.

Commerce and Banking.—The Federal Reserve banking district of Philadelphia includes eastern Pennsylvania, the whole of Delaware and all of New Jersey excepting that which lies in the metropolitan area of New York, and is the location of one of the 12 Federal Reserve banks of the United States. The Philadelphia clearing-house transactions for nine months ended 30 Sept. 1918 amounted to \$14,276,449,469, an increase of 13 per cent over the corresponding period in 1917. The following is a summarized bank statement of the incorporated banking institutions located in the city, compiled from the latest available State and Federal reports:

INSTITUTION	All resources	Loans and discounts	Investments, cash and credits	Capital and surplus	Deposits	Savings and trust funds
28 national banks....	\$587,570,426	\$323,937,328	\$263,633,098	\$70,391,065	\$320,040,514	\$5,979,814
58 trust companies....	1,459,453,043	175,996,749	1,283,456,294	114,777,949	256,096,516	1,070,497,763
18 State banks.....	11,597,756	6,960,890	4,636,866	2,198,280	6,013,243	2,874,958
Total.....	\$2,058,621,225	\$506,894,967	\$1,551,726,258	\$187,367,294	\$582,150,273	\$1,079,352,535

The miscellaneous liabilities of the national banks were \$191,159,033, including bank notes in circulation; of the trust companies, \$18,090,855; State banks, \$511,275. About two-thirds of the investments of the national banks were United States and other bonds deposited in the Treasury as security for circulating notes. Very nearly \$1,000,000,000 of trust company investments included in the foregoing statement are held by these institutions as trustees only and represent a corresponding amount of individual trust funds. In addition the trust companies of Philadelphia are mortgage trustees for corporate bond issues to the amount of approximately \$2,200,000,000 (face value), and hold securities pledged as collateral for trust bond issues to the value of nearly \$700,000,000.

The United States customs district and port of Philadelphia (Act of 24 Aug. 1912) includes all of the State of Pennsylvania east of 79° W. longitude, all of Delaware and all of New Jersey not included in the New York district. Chester, Pa., Wilmington and Lewes, Del., and Tuckerton and Thompsons Point, N. J.,

are subports. The business of the port of Philadelphia has grown more than proportionately to the growth of the population and industries of the metropolitan district. The exports for four years ended 30 June 1914 were about \$280,000,000 in value; in the four years ended 30 June 1918 they amounted to \$1,195,000,000, a fourfold increase. The imports in recent years have averaged \$110,000,000 per annum; about 50 per cent increase. The Federal government is maintaining a 35-foot channel in the Delaware to the sea. More than 4,000,000 tons of coal are shipped annually by water from the storage yard at Port Richmond. The new grain elevator at Girard Point has a capacity of 2,200,000 bushels and is capable of delivering 60,000 bushels per hour, and there is docking room for three vessels at its pier. The ore piers at Richmond and Girard Point have unloaders which can handle from ship to car 1,000 tons per hour. Almost 45 per cent of the gross tonnage of exports from Philadelphia consisted until quite recently of oil from the refineries of the lower Schuylkill. There has been a great industrial expansion northward from Chester to Philadelphia which gives indications of permanence and emphasizes the suggestion to direct and plan the development of this region as a unit, with a coherent street systems, docks, basins, warehouses, terminals, a factory district and residential areas with parks and playgrounds. A consolidation of a score of small municipalities would be a prerequisite. The area is traversed by three railroads and has a frontage on deep water affording sites for wharves 2,500 to 3,000 feet long. A tunnel under the Delaware affording direct freight routes to New York and the East and railroad connections with the trunk lines to the West and South are other essentials. The project would bring the new port of Philadelphia 10 miles nearer to the sea and establish it

below the Horseshoe, whose always dangerous shoals and occasional ice blockades could thus be avoided by shipping.

Buildings.—The architecture of Philadelphia was determined by the building material nearest to hand—azoeic marble, red sandstone and glacial clay, giving brick. Penn's town residence (the Letitia House) in Fairmount Park and his grandson's manor in the Zoological Garden, with the Chew mansion and various early homes in Germantown, begin the list of historic edifices, wherein are included some of the best examples of colonial architecture known. These are Independence Hall and Christ Church both following Gibbs' models and designed by John Kearsley, and the Pennsylvania Hospital, erected a few years later, constructed of brick imported from England. Ridgeway Branch of the Philadelphia Library (Doric) and Girard College (Corinthian) by MacArthur illustrate Neo-Grecque at its best. Le Brun's Roman Catholic cathedral and Academy of Music reflect the first appearance in the city of Renaissance, while Notman's

Saint Mark's is one of the earlier examples of Gothic. The vast, clumsy, marble pile of the city hall covers four and one-half acres; its fronts are 90 feet high, the central pavilion 303 feet and the tower 547 feet, 11¼ inches—2¾ feet shorter than Washington Monument, which it was intended to excel. It is 470 feet square, has 15 acres of floor space, has cost \$25,000,000, and its design by MacArthur is derived from the style of the Second Empire. On the same square front the Masonic Temple (Norman) by J. T. Windrim, and the Pennsylvania Terminal (English Civic Gothic) by Frank Furness, with florid sculptures by Carl Bitter. Other noteworthy buildings are the Art Club and Horticultural Hall, both designed by Frank Miles Day, and the new United States Mint. The designs for the Municipal Art Museum by Borie, Dantzinger and Trumbau, and the Free Public Library (Renaissance) by Horace Trumbauer, have been approved by the art jury, whose powers have also been exercised to make the numerous new railroad bridges ornaments to, rather than disfigurements of, the streets and streams they cross. The skyscrapers came late to Philadelphia; but there are now quite a number, the best in design being the Wanamaker Store (marble) and the Bell Telephone Central (limestone and brick), J. T. Windrim, architect. The principal monuments are the Soldiers and Sailors' Memorial in Fairmount and the Washington Monument at the Spring Garden entrance to the park. There are a number of equestrian and other bronze statues scattered over the city, which it is proposed to remove to more appropriate surroundings and in more fitting settings along the Parkway.

Street Railways, etc.—The narrowness of the streets in the older parts of the city permits the running of surface car lines in only one direction on all but the few 100-foot thoroughfares, some 30 miles in length. Over 400 miles of the paved streets are tracked. All of the trolley lines have been combined in operation under one corporation, the Philadelphia Rapid Transit Company, with a capital of \$30,000,000. This corporation has constructed a high-speed line (subway and elevated) from the Delaware River to 69th and Market streets, where there is connection with suburban electric railways to West Chester, Ardmore and Norristown. The agreement of 1907 with the city requires payment by the Rapid Transit Company for the repair and repavement of streets occupied by its lines, in accordance with the franchises of the underlying corporation. The payments on this account have averaged about \$500,000 a year, and will continue during the life of the contract, which runs for 50 years. The city was also to receive one-half the net income from operation after deducting interest, guaranteed dividends and other fixed charges and current obligations of the operating company. Up to date nothing has come to the city from this source. The city is represented on the company's board by three directors, of whom the mayor, ex officio, is one. The Pennsylvania and the Philadelphia and Reading own 360 miles of track within the municipal area, reaching the centre of the city on viaducts and furnishing belt freight lines as well as suburban passenger service. Grade crossings, of which there are several hundred, are being

eliminated, the city sharing the expense. Those on the Philadelphia and Reading lines have been abolished to a very large extent; most of those on the Pennsylvania lines will be abated by the elevation of that company's existing and projected freight tracks to the water front. The city-owned high-speed lines, for which \$63,000,000 have been appropriated and made available through authorized loans, provide a comprehensive system of intramural transit facilities. The system includes a subway on Broad street, construction of which has been begun; an elevated line to Holmesburg, which is nearing completion, with a surface line extension to Bustleton; a subway on Chestnut street from the Delaware to the Schuylkill, extended by elevated road to Darby; a delivery loop (subway) in the heart of the city; a Parkway subway with an elevated extension to Roxborough. The total mileage of the system as approved is 50, of which 15.4 is subway, 24.5 elevated and 10.1 surface road. These with existing high-speed lines, steam and electric, will give service radially from the city's centre in every direction.

Parks and Playgrounds.—Fairmount Park began with five acres, purchased in 1812 for the waterworks and opened in 1825. It was enlarged to 41 acres in 1855 and to nearly its present dimensions in 1867-68, when a number of country estates on the Schuylkill were expropriated. Fairmount Park includes 373 acres of water surface (Schuylkill River), and its total area is now about 3,546 acres, but this is being added to constantly. By a legislative act of 1917 the condemnation of between 1,100 and 1,200 acres in the Wissahickon Valley was ordered. This will include Fort Washington, second in its historic associations only to Valley Forge. Up to the end of the 19th century the most considerable additions to the city's park area outside of Fairmount were Hunting Park (86½ acres) in North Philadelphia and Bartram's Garden (27 acres) on the lower Schuylkill. A large number of small squares have since then been confirmed on the city map. The more important accessions, however, have been quite recent. Among these are League Island Park (300 acres); Pennypack Park (726 acres); Tacony Creek Park (250 acres); Cobb's Creek Park (288 acres). The last three follow the valleys of the creeks for which they are named from four to six miles. The bank of the Delaware from Torresdale to Tacony, owned by the city and the site of pumping stations, filtration plants and other municipal works and institutions, given landscape garden treatment as intended, will provide nearly four miles of river front park connecting with Pennypack, the largest of the "creek" parks. Burholme Park (69 acres); Whitehall Commons (35 acres); Fernhill Park (10½ acres); Wister's Wood (37 acres) and the Cope Arboretum (22 acres, donated to and administered by the City Park Association) are all in the north-eastern or northern sections of the city. The total park area of Philadelphia, including squares and parkways, is 6,000 acres—only a little more than one-third the park area of metropolitan Boston. The Fairmount Park commission governs most of these parks, but some are under the control of the department of public works. Permanent playgrounds, 22 in number (several of them donations of public-

spirited citizens—Happy Hollow is the most famous), have been opened by the board of recreation since it came into existence. Of these, eight, averaging four acres in area, are provided with recreation centre buildings. The other 14, which average about two acres in extent, have equipment and are enclosed, and four of them have swimming pools. The attendance is in excess of 2,500,000. Of the 248 school yards in the city, 106, averaging one acre in dimension, are operated as playgrounds in the summer under direction of the board of education. The attendance at the public bath-houses maintained by the municipality exceeds 3,000,000 in a season.

Libraries, Museums, Etc.—There are 65 libraries and reading-rooms in the city. The Philadelphia Library Association—an outgrowth of Franklin's "Junto" founded in 1731—has 250,000 volumes, equally divided between the main library at Locust and Juniper streets and the Ridgeway Branch at Broad and Christian. It is sustained to the extent of one-half of its disbursements by endowments, the largest being that made by Dr. James Rush—\$1,300,000, including the value of the very handsome building for the Ridgeway Branch. The Mercantile has about 200,000 volumes. The library of the University of Pennsylvania, housed in the most ornate structure of the grounds, has had a remarkable growth, increasing in 10 years from 60,000 to over 400,000 volumes. The other large libraries in the city are technical or otherwise specialized in character; the Academy of Natural Sciences, 50,000 volumes and 15,000 pamphlets; Drexel Institute, 27,000 volumes; Franklin Institute, 51,000 volumes, and American Philosophical Society (principally transactions), 35,000. The Pennsylvania Historical Society has a large collection of Americana, chiefly of the Middle States. All of these are open to non-members for consultation, a concession exacted from subscription and association libraries in return for exemption from taxation. The Free Library of Philadelphia was established under a charter granted February 1891; it is governed by a board of trustees pursuant to ordinances of the city councils and an act of assembly. The principal trust funds are bequests of George S. Pepper, R. G. White, George B. Roberts, William Brooke Rawle and Jonathan Livezey. The plant consists of the main library, at 13th and Locust streets, and 27 branches, of which 21 occupy buildings erected from Andrew Carnegie's gift of \$1,500,000 to the city. Of the sites for these 15 were donated by citizens of Philadelphia, and two branch buildings, including the ground on which they stand, are gifts of the late P. A. B. Widener and Robert Ryerss. The library building now contains 534,152 volumes and 274,821 pamphlets. During 1917 3,148,509 volumes were lent for home use, including 1,280,943 books taken out and read by children. In addition 1,831,580 persons used the library buildings for reading and study. On 12 May 1917 ground was broken for the new main building, which is being built by the city on the Parkway. This great building, which will have a shelving capacity for more than 1,500,000 volumes, will be an ornament to the Parkway and in every way worthy of the city.

The Philadelphia Commercial Museum is the only institution of its kind in the United States.

Its object is the promotion of international trade by diffusion of knowledge of the resources and needs of foreign countries. It occupies a group of buildings at 34th and Spruce streets, where it maintains a very complete exhibition of fibres, minerals and other raw material of industry, illustrative of the commercial geography of the world.

The Academy of Natural Sciences has possibly the largest of all collections of butterflies and marine shells. The Museum of Science and Art of the University of Pennsylvania is notable for its Oriental ceramics, its archaeological collections, illustrative of the most ancient civilizations of the Mediterranean Basin, Egyptian, Assyrian, Minoan, etc., and of the ethnography of America. The Franklin Institute shows models of epoch-making inventions. The nucleus of a superior museum of fine arts exists in the Wilstach collection, now housed in Memorial Hall at Fairmount Park. The collection bequeathed to the city by the late J. G. Johnson is on exhibition at the donor's former residence, in accordance with the conditions of the bequest; but it will have to be removed to the projected Art Museum building to protect it from fire and other risks. There are others, notably the superb Widener and Elkins collections, which will inevitably gravitate to the municipal museum. The Academy of Fine Arts has an almost complete collection of portraits by Stuart and a permanent free exhibition of earlier and modern American art, which is outgrowing its space. The display in Independence Hall constitutes a historic art museum in itself and the Fairmount Park Art Association has an endowment fund of \$800,000 for the purchase of works of sculpture.

Philadelphia has two opera-houses, the Academy of Music and the Metropolitan, and there are five theatres of modern construction. Mrs. Drew's Arch Street Theatre is still in service; in recent years it has given a home to German and Yiddish drama and vaudeville.

Education.—The Provincial Council, 26 Oct. 1683, provided for the hire of a school-master, and established the fees to be charged for his tuition in the ordinary English branches. In 1689 the William Penn Charter School was opened, chartered 1697, and has been continuously in operation down to the present time, its building standing now, as it has for many years, at 12th and Market. In 1743 the Academy and Charitable School of the Province of Pennsylvania was outlined by Benjamin Franklin, urged in a pamphlet in 1749, and the common council of the city began in 1750 the policy, followed by the city since, of establishing scholarships by giving £200 in cash, £50 per annum for five years and an additional sum for each scholar sent to the Charity Department. Out of this academy grew the University of Pennsylvania.

Public schools for "indigent" children were opened in 1818. There were 6 schools with 10 teachers and 2,845 pupils, about one-fourth the population of school age. Since 1830 the public schools have been free to all, and in 1838, 20 years after their first opening, the number of pupils was 18,794, seven times the original attendance—and there were 167 schools with 257 teachers. The law of 1912 established Philadelphia as a school district in the State's department of public instruction and empowered

the board of education to levy the school tax and borrow money independently of the city council. In 1917 the board expended a total of \$11,371,018. A remarkable development of the public school system has been the growth of the high school attendance. The high school enrolment now exceeds 18,000, more than three times the number 10 years ago. There are more than 1,600 applicants annually for admission, and to obviate the construction of a new building each year the freshmen classes are segregated in a junior high school. Besides this junior high school there are 11 academic high schools, one industrial arts high school, two schools for trades and higher vocational training, the Normal School with two adjuncts, and the School of Pedagogy, giving two years' post-graduate courses for female and male scholars, respectively, who are qualifying for the profession of teaching. There are also five evening high schools and one evening trade school for those unable to attend in the daytime. The elementary schools are 197 in number and there are 20 elementary evening schools. Vocational training (elementary) is now given to all pupils of the 7th and 8th grammar school grades—in 48 metal and woodworking shops; 48 domestic science classes (cooking, etc.); 40 classes for elementary instruction in the industrial arts (three times that number are required), and there are 122 sewing classes. In 1917 the enrolment in elementary schools (including 8,281 in continuation classes and nearly 3,000 in special classes for the backward and other subnormals) was 212,599, and the grand total for all the public schools was 232,051. The school buildings owned by the district number 328, and there are 17 portable and 12 rented buildings in use. The equipment has been greatly improved since 1912 and the new buildings are models of their kind. In addition the city pays for the tuition of 200 graduates from the public high schools at colleges and professional schools and provides also more than 400 scholarships at the various art schools in the city. The parochial schools in the city—chiefly Roman Catholic—contain about 35,000 pupils and private schools nearly 3,000 more. Girard College, founded by Stephen Girard, has an endowment of nearly \$15,000,000 and receives white male orphans from 9 to 19 years of age. It has about 1,600 pupils.

The University of Pennsylvania has about 330 instructors and over 3,000 students. It maintains in its collegiate department, in addition to the usual curriculum, technical courses in architecture, mechanical engineering, music, etc. Its law school has about 400 students. The university, originally upon the site now occupied by the post office at 9th and Chestnut streets, is now at Woodland avenue and 33d street, where since the removal in 1876 there have been constructed 29 buildings, including a library, a museum, a hospital and a botanical garden. The city receives 50 free scholarships in return for its grant of the land on which the university stands. Philadelphia is, and has long been, famous for its medical schools. The university medical department, established 1765, was the first in the United States. Besides this, the best-known medical schools are Jefferson, Medico-Chirurgical, Woman's and Hahnemann. All of these give

four-year courses and have university privileges. The College of Pharmacy is one of the best in the country. Divinity schools are maintained in the city by the Presbyterian, Lutheran, Reformed, Protestant Episcopal and Roman Catholic churches. These seminaries have had for a number of years an average of 1,500 students. Approximately 1,200 students attend the four dental schools in the city, including that of the university. Industrial training for the indigent is provided at Girard College and at the Williamson Trades School, just outside of Philadelphia, which has an endowment of \$2,000,000. The Drexel Institute gives courses in mechanical drawing, engineering, architecture, chemistry, dressmaking and domestic economy. The Pennsylvania Academy of Fine Arts is the oldest institution of its kind in America and gives instruction in applied as well as in high art. The Academy, the Pennsylvania Museum and School of Industrial Art and the Woman's School of Design (Spring Garden Institute) are attended by an aggregate of nearly 3,000 pupils.

Hospitals, Etc.—There are about 2,500 associations of religious and humanitarian character and aims. The realty owned by these bodies and exempt from taxation is of the value of more than \$50,000,000, which is divided in nearly equal parts between churches and charitable and educational foundations. About 1,500 agencies are directly engaged in the relief of physical suffering. Of these 40 are special and 22 general hospitals, with 16 dispensaries. The city maintains four homes for the indigent; the latest published official census shows 204 male and 473 female inmates at the old almshouses in West Philadelphia, 947 old men at the Holmesburg Home and 160 women at the Brown farm. The Municipal Hospital (for contagious diseases) maintains an ambulance service, which makes an average of 10 calls per day, averaging nine and one-half miles per run. The Philadelphia (public) Hospital for the Insane has a world-wide reputation and cares for upwards of 2,000 patients; more than 500 other insane persons are treated and kept occupied on the city farms at Ryberry. The Philadelphia General Hospital (Blockley's) has usually more than 2,100 inmates under treatment. Of private charitable institutions the Pennsylvania (free) Hospital, founded by Franklin in 1751, and its filiate for the treatment of mental and nervous diseases (Kirkbride's) are still foremost. Other large hospitals are the Episcopal, Saint Joseph's, Mount Sinai, German, Jefferson, Polyclinic, Medico-Chirurgical and Pennsylvania University. Among other semi-public charitable foundations the Pennsylvania Institution for the Deaf and Dumb, established 1820; the Home for Training in Speech of Deaf and Dumb Children; the Pennsylvania Institution for the Blind, established 1820; the Pennsylvania Training School for Feeble-minded Children, established 1853; the Widener Home for Crippled Children; the Children's Aid and the Society for the Prevention of Cruelty to Children are conspicuous.

STEPHEN PFEIL,

Formerly of the Philadelphia 'Press.'

PHILADELPHIA, Academy of Natural Sciences of, an institution for the advancement of learning in the natural sciences, founded in 1812. It has a large and handsome building in the city of Philadelphia and conducts its highly organized work through four principal departments: the library, the museum, the publication office and the department of instruction and lectures. The library has grown chiefly by gifts and numbers upward of 80,000 volumes and many more thousands of pamphlets. It is essentially a reference library. The museum is one of the most important in the world. The collections are in two grand divisions: one for public exhibition, and the other for study by specialists, some of whom come from great distances to avail themselves of its unequalled advantages. Of vertebrate animals there are over 130,000 specimens, comprising 12,000 mammals, 60,000 birds, 20,000 reptiles and 40,000 fishes. Insect specimens number over 400,000 and of shells there are more than 1,500,000—the largest collection in the world. There are upwards of 50,000 fossils; 30,000 minerals; 20,000 archaeological objects and more than 900,000 dried plant specimens in the herbarium. The several series of publications have filled nearly 150 volumes, the annual output being nearly 2,000 pages, with a large number of plates both in half-tone and color. Lectures have been given since 1814. Besides the regular evening winter courses, special educational series are given to schools. For 25 years past all lectures have been free to the public. A number of scientific clubs make the Academy their headquarters, meeting there at regular intervals. Among these may be mentioned the Delaware Valley Ornithological Club and the Philadelphia Botanical Club. The Academy provides opportunities for scientific education free to worthy students. Its regular periodical publications are its *Proceedings* and *Journal*.

History.—Within a few months after its founding a considerable number of valuable scientific works had been presented to the new association, forming the nucleus of its now famous library; and the museum now renowned the world over began its existence with a few contributions by the members, and a collection

of 2,000 specimens of minerals purchased upon pledges. By 1814 the Academy had 14 members and 33 correspondents and courses of lectures in botany and entomology were arranged. The *Journal* first appeared in 1817. The necessity for larger quarters led to the purchase of a small meeting-house in 1826, and there the museum was first opened to the public in 1828. The Academy's second building was erected especially for its purpose in 1839. This was enlarged in 1846, and again in 1855. In 1860 the Thos. B. Wilson collection of birds, then the largest in the world, which had long been on exhibition in the museum, was given to the Academy. It comprised 20,000 mounted specimens and 2,000 skins. In the same year a publication fund and several endowment scholarships were established through gifts to the Academy. At this time the *Proceedings* and the *Journal* were the most important publications on natural history in the United States. A large and handsome building was completed in 1876 on Logan square and the collections and library were installed the same year. From this time the growth of the institution was rapid and through appropriations from the State legislature additions have been made to the building from time to time—in 1890, 1892, 1908 and 1911 until the original building has been trebled in size, a fine library stack and reading-room having been added to house the scientific library which is unrivalled in America. In 1912 the Academy celebrated its first centennial and delegates or messages were received from upwards of 500 societies throughout the world. During its long history the Academy has taken part in very many important scientific explorations and some of its members took part in Long's Expedition to the Rocky Mountains (1819-20); the United States Exploring Expedition (Wilkes' Expedition, 1838); Dr. Kane's and Dr. Hays' Arctic expeditions; Audubon's Missouri River Expedition; the first Peary Arctic Expedition (1891-92). The Academy financed one of Du Chaillu's African expeditions and sent members of its staff on exploration to Mexico and Yucatan (1890), and to various parts of the western United States. The institution has also furnished from its membership time and again eminent scientists for posts in various government departments and elsewhere, while the Jessup Scholarship Fund left in trust to the institution has been instrumental in developing many young men who have made their mark in science, by making it possible for them to pursue their studies in science at the Academy.

PHILADELPHIA, The College of Physicians of, an association of physicians founded at Philadelphia on 2 Jan. 1787, having for object, according to its first constitution, "to advance the science of medicine, and thereby to lessen human misery, by investigating the diseases and remedies which are peculiar to our country, by observing the effects of different seasons, climates and situations upon the human body, by recording the changes that are produced in diseases by the progress of agriculture, arts, population and manners, by searching for medicines in our woods, waters and the bowels of the earth, by enlarging our avenues to knowledge from the discoveries and publications of foreign countries; by appointing stated times for literary intercourse and communications, and by cultivating order and uniformity

in the practice of physick." At first the college consisted of 12 senior fellows and an indefinite number of junior and associate fellows; the senior and junior fellows being chosen from physicians who resided "in the City or District of Southwark or Liberties of Philadelphia," and the associates from "such persons of merit in the profession of medicine" who did not live within these described limits. The first three presidents were John Redman, William Shippen and Adam Kuhn. The college was incorporated on 26 March 1789. The college was never a teaching institution in the ordinary sense of that term, nor has it the power to confer degrees. It has the right only to bestow fellowship and associate fellowship upon those who are eligible for these honors and to elect a limited number of corresponding members. It is, therefore, a scientific body, and once a month, except during July, August and September meetings are held at which papers on medical, surgical and allied subjects are read and discussed. These are published in the 'Transactions,' the first volume of which appeared in July 1793. At an early period in its history the college assumed a guardianship over the health, safety and even the morals of the community. The first standing committee, that on meteorology and epidemics, had a continued existence from 1787 to 1882. The members of the college did much to combat the epidemics of yellow fever in Philadelphia which were frequent prior to 1820. The college took a prominent part in all movements for the betterment of public health, such as the establishment of a quarantine and hospital for contagious diseases, of hot and cold baths, of the regulation of the practice of physic within the State, and its important actions in relation to the preparation of the Pharmacopœia of the United States. Within recent years, however, the college has confined itself in largest measure to the discussion of scientific matters. The new building of the college was completed and occupied on 10 and 11 Nov. 1909. Here is maintained a large library of over 100,000 volumes, an equal number of unbound pamphlets and 165 medical incunabula. The library is free and is open to any one who is interested. Only Fellows have the privilege of taking books from the building. About 1,200 current periodicals are received. The Mütter Museum is one of the features of the building, with its hundreds of pathological specimens. The museum is open to all research students, medical students and physicians under proper regulations. In 1882 a Directory for Nurses was organized. Since the foundation, 935 Fellows, 91 American Associate Fellows, 51 Foreign Associates and eight Corresponding Fellows have been elected. At present there are 404 Resident Fellows, 27 Non-resident Fellows, 20 Foreign Associate Fellows and four Corresponding Fellows. Several series of lectures are given, under the provision of various endowments, to some of which all physicians and even the general public are admitted. Consult Henry, F. P., 'Historical Sketch of the College of Physicians of Philadelphia' (New York 1909), and Schweinitz, G. E. de, 'Account of the College of Physicians of Philadelphia' (Philadelphia 1912).

PHILADELPHIA, Destruction of the, one of the boldest and most daring exploits in

naval history. This American frigate had pursued a piratical Moorish vessel into the harbor of Tripoli, 31 Oct. 1803. In endeavoring to beat off from the harbor the *Philadelphia* struck on a sunken ledge which was not laid down in the charts. The Tripolitans at once sent out nine gunboats to attack the helpless vessel, and Captain Bainbridge, in command of the *Philadelphia*, had no resort except to surrender. He, however, first threw all his guns overboard and scuttled the ship, so that if she were pulled off the ledge she would go to the bottom. He and his men were treated humanely. Captain Bainbridge succeeded in sending information of his misfortune to Commodore Preble, in command of the American squadron at Malta. Meantime the Tripolitans had worked the frigate off the rock, plugged the holes in her bottom and removed her into the harbor, where they were fitting her out to be used against the Americans. Captain Bainbridge devised a plan for the destruction of the *Philadelphia* and managed to send it by letter to Commodore Preble who assigned Lieut. Stephen Decatur to the dangerous task. Lieutenant Decatur with 74 volunteers started on his errand 9 Feb. 1804 in a small vessel called a "ketch," which had been captured by the Americans and christened the *Intrepid*. The *Siren*, Lieut. Charles Stewart, accompanied the *Intrepid* to cover the retreat. A gale sprang up and for six days the men who crammed the "ketch" to its capacity were practically imprisoned and compelled to subsist on half-rations. On 15 February the gale passed and the expedition was resumed. It was a moonlight evening, and as the officers and men were concealed below, the *Intrepid* looked to the Tripolitans like an innocent merchant vessel. A hail from the *Philadelphia* was answered in Maltese, and as the *Intrepid* was warped alongside the frigate, the Americans sprang from concealment, rushed on board and, after a fierce hand-to-hand attack, the Tripolitans threw themselves into the sea. The fire squads went promptly to their stations with the combustibles and the *Philadelphia* was fired in four places. Then under the glare of the flames, with no wind, the "ketch" was slowly moved out of the harbor by sweeps, a target for 115 heavy cannon in the land fortifications and for 24 gunboats and other heavily armed craft which took up the pursuit. The retirement, however, was made without mishap. Parts of the water-logged timbers of the *Philadelphia* were recovered by Captain Breese of the *Cumberland* in 1844 and converted into souvenirs.

PHILADELPHIA (Tenn.), Military Operations at. Philadelphia, a station on the railroad from Chattanooga to Knoxville, south of Holston River, was held in September 1863 as an outpost to Burnside's army, which was north of the Holston and spread out widely throughout the valley of eastern Tennessee, in the endeavor to keep the entire country clear of the numerous bodies of Confederate troops which threatened it at several points. On 27 September the Union troops were driven from the place and other points south of the river by the Confederates, who had advanced to threaten Burnside at Loudon and to cover a cavalry raid upon Rosecrans' communications with Nashville. In this advance the Confederates captured at various points 6 guns, 50 wagons and some 600 to 700 prisoners. About

8 October Philadelphia was reoccupied by Colonel Wolford, with his Union cavalry brigade of 2,200 men and six guns. Wolford's force was made up of the 1st, 11th and 12th Kentucky Cavalry and the 45th Ohio Mounted Infantry. On the 19th Gen. C. L. Stevenson ordered the Confederate cavalry brigades of Colonels Dibrell and Morrison, numbering about 7,000 men to move upon Philadelphia and capture Wolford or drive him across the Loudon. Dibrell was to move from Cleveland and attack from the south, while Morrison, marching from Wolf River Bridge, was to gain the Loudon road and attack from the north. Morrison, with 1,800 men, in approaching the Loudon road from the west, on the morning of the 20th captured a foraging train with its guard of 40 men, and in quick succession the 11th and 1st Kentucky Cavalry were sent by Wolford to recapture it. A fight ensued, with varying success, but Morrison finally interposed between the two regiments and Philadelphia, driving them in the direction of Loudon, and gaining the road two miles in rear of Philadelphia. Meanwhile Dibrell, moving through Sweetwater, came in sight of Wolford's 12th Kentucky and 45th Ohio, with the six-gun battery, and at 1 p.m. opened with his artillery and charged with his cavalry, but met with such a determined resistance that he was held at bay, and the action on that front lapsed into an artillery duel. Morrison now came up in Wolford's rear, dismounted his men and began his attack. Leaving a small party to oppose Dibrell, Wolford, with his two regiments of 700 men and his battery, turned upon Morrison, repulsing several attacks. After three hours' fighting the artillery ammunition was entirely exhausted, and the carbine ammunition nearly so; Dibrell was closing in on one side and Morrison on the other; and Wolford ordered a sabre-charge to cut his way out to Loudon. He dashed against Morrison and broke through, just as Dibrell was cutting into his rear, detaching scores of prisoners. He left his guns, ambulances, 30 wagons, many horses and mules and 324 prisoners in the hands of the Confederates, and made his way in some confusion to Loudon, taking with him some 50 Confederate prisoners. He was joined on the road by the 1st and 11th Kentucky. Morrison followed until he came in sight of Burnside's infantry near Loudon. The Union loss was 32 killed and wounded and 447 captured. The Confederate loss was 15 killed and 82 wounded, and 111 prisoners.

PHILADELPHIA AND READING RAILWAY COMPANY, a public utility corporation, incorporated in Pennsylvania, 17 Nov. 1896, to acquire the railroad lines of the old Philadelphia and Reading Railroad, which were sold under foreclosure on 23 September of that year. The company operates the railroad formerly leased to the old company, either through transfer of the old leases or through creation of new leases. Its entire rolling and floating equipment is leased from the Reading Company, which equipment it undertakes to maintain unimpaired as to capacity and efficiency. The company is largely engaged in the transportation of coal from the first and second anthracite coal fields in Pennsylvania to tidewater at Port Reading, N. J., and Port Richmond, Phila-

delphia. The terminals at the latter port cover 140 acres of land and include an extensive system of piers and wharves from whence the company operates a service of sea-going barges and tugs distributing coal to many points along the coast. The yard comprises over 80 miles of track and has accommodations for over 6,000 freight cars. There is a grain elevator with a storage capacity of 1,500,000 bushels and discharging capacity of over 30,000 bushels an hour. There is also an ore-unloading plant and pier with a discharging capacity of 600 tons per hour. On 31 Dec. 1918 the Philadelphia and Reading Company owned 386.79 miles of first track, 186.77 of second track, 75.48 of third and fourth tracks and 620.33 miles of sidings and laterals, making a total of 1,269.37 miles of track. On the same date the company held under leases, 705.92 miles of first track, 379.57 of second track, 50.71 miles of third and fourth tracks and 546.52 of sidings and laterals, a total of 1,652.72 miles under lease. In addition it held trackage rights over 34.46 miles, making a grand total of 2,956.55 miles over which it operates. The main line has 105.63 miles of first track and a total of 595.11 miles of all tracks and sidings; main line branches have total trackage of 56.05 miles; Lebanon Valley branch, 55.48 miles of first track and 243.93 miles of all tracks, etc. On the above date the rolling stock and floating equipment were as follows: 1,028 locomotive engines and tenders, worth \$13,334,265; 42,487 revenue freight cars, worth \$42,591,681; and capacity of 3,581,408,000 pounds; 954 passenger cars, worth \$5,193,047; and 620 work cars, worth \$460,103; 21 sea tugs, worth \$1,518,906; and 114 sea barges of 83,478 regular gross tons, worth \$2,651,017, making a total valuation of rolling and sea-going equipment over \$65,500,000. In 1918 the income from all sources aggregated \$16,570,754.88; the various deductions from income \$8,060,292.90, leaving a net income of \$8,510,461.98. Of the latter \$6,858,568.24 was appropriated for investment in physical property, leaving a balance transferred to profit and loss of \$1,651,893.74. The capital stock amounted to \$42,481,700; the funded debt, \$49,495,585.61; current liabilities, \$5,852,618.77; unadjusted credits, \$26,946,257.89; deferred liabilities, \$1,373.70; additions to property through income from 1907 and charged as an asset, \$28,861,046.35; profit and loss, \$10,780,898.74, a total liability of \$164,946,404.48. The main line is from Philadelphia to Reading; branches: Reading to Harrisburg, Lebanon to Pine Grove and Auburn, Pine Grove to Rockville, Reading to Shenandoah, Mahanoy Plane to Port Trevorton, with numerous shorter branches in the coal regions.

PHILADELPHIANS, a sect or society of mystics founded in London toward the close of the 17th century by Jana Leade and Dr. John Rordage; the latter a follower of the German mystical philosopher, Jacob Boehme, whose complete works had been translated into English and published at intervals between 1644 and 1662. There had already existed a society or sect of Boehmenists in England with a membership made up of cultured people and simple, but it became merged into Quakerism. The philosophy of Boehme had a special attraction for cultured mystics, and such were Dr. Francis Lee, Dr. Lot Fisher, Dr. Thomas Bromley

PHILAE

2 Colonnade of Ptolemy IX

and others who became founders of the Society of the Philadelphians or of Brotherly Love. The belief peculiar to the Philadelphians was that of possible intimate communion with the spiritual realm, which, years afterward, marked the teachings of Swedenborg. The Society gathered a large following among the members of orthodox churches who retained such membership while subscribing to the doctrines of the Philadelphians. Many of these were in Holland and Germany, to which countries the Society sent literature and missionaries. Consult Illgen, 'Zeitschrift für Historische Theologie' (1865, Vol. II, pp. 171-290).

PHILADELPHUS, or **MOCK ORANGE**, commonly known in America as *Syringa*, which is, however, the botanical name of the lilac. The name "Mock Orange" arises from the similarity of perfume of the flowers of the syringa and the orange. It is a genus of deciduous or sub-evergreen shrubs of the order *Saxifragaceæ*, and thus related to the *Deutzias*. The species, of which about 30 have been described, are natives of the Northern hemisphere, and very widely distributed, being found in China and Japan, the Himalayas, Mexico and the Pacific Coast of the United States. They have three-nerved leaves, flowers in racemes or solitary on little twigs and many-seeded dehiscent fruits (capsules). Twenty of the species recognized by Koehne are indigenous to North America. The popular name, "syringa," by which several of the species are widely known in America, is misapplied. *Syringa* is the generic name for lilac. The species are mostly hardy in the Northern States, tropical and sub-tropical species generally excepted. They are readily propagated by means of division of the roots, layers, suckers, cuttings and seeds. But since the species readily intercross, seeds are rarely used except for producing new varieties. They will thrive in any ordinary, well-drained soil and in any degree of sunlight; some will even stand shade, but they thrive best in a deep, moderately rich loam. The flowers appear in early summer upon twigs of the previous year. Pruning is rarely needed, especially in the case of the tall-growing sorts, but, when necessary, should be given in summer just after the plants have blossomed. The popular garden forms are much alike in appearance, but there is a great difference in fragrance. Probably *P. coronarius Chinensis* is the most common. It is a native of western Asia and southern Europe, and is one of the most fragrant. Some very remarkable and valuable varieties have been developed by florists through hybridization. They produce flowers of twice the size of the parent stocks, reaching over two and one-half inches in diameter, and some semi-double and double sorts have been created. Among the more desirable varieties may be named the Lemoine hybrids: *Avalanche*; *Fantaisie* (tinged with rose); *Mont Blanc*; *Purpureo-maculatus* (purple-spotted); and *Virginal* (double). The Lemoine varieties require quite vigorous pruning and make fine single specimens when kept dwarf upon a single stem.

PHILÆ, fi'lê, a small island of the Nile in Upper Egypt, on the old boundary of Ethiopia, about seven miles south of Assouan and on the upper side of the First Cataract. The

name *Philæ* seems to be an attempt to reproduce in Greek *Pilak* or *Pilakeh*, a Coptic word meaning "corner" or "end," given because of the border site of the island; it is now called Jeziret el-Birba, "Temple Island," or Jeziret Anas el-Wogud, "Island of Anas el-Wogud," as the scene of a tale in the 'Arabian Nights,' whose hero is so called. The present site of the island is within the Assouan reservoir; see plate accompanying article ASSOUAN. The reservoir waters overflow the island and partially submerge the temples, except from August to December of each year, when the gates of the dam are open and the river falls to its accustomed flood level, but elaborate precautions were taken to strengthen the foundations of the various temples; these are described in the article ASSOUAN. A minute inspection made in 1907 showed that there had been no settling, and except for the blurring of some inscriptions at the base of sandstone structures, which had become infiltrated with salts from the mudhouses built against them, the ruins were unchanged. To some extent, however, there has been discoloration of the sandstone from iron and manganese in its composition. "Temple Island" is the most expressive appellation for this place, which was sacred to Isis and is covered with remains of the best preserved temples of all Egypt. The island is scarcely less remarkable for its position high above the surrounding waters, so that it was never overflowed until the building of the Assouan dam, and for its beautiful vegetation, luxuriant palms and mimosas, than for the adaptation of Egyptian architecture, usually massive and majestic, to the exigencies of an island 1,500 feet long and 480 feet wide. The monuments of Nectanebo II (4th century B.C.) are the oldest now existing on the island or anywhere mentioned in inscriptions as having been built here. The temple of Isis, which was doubtless antedated by an important cultus, was begun in the time of Ptolemy II Philadelphus, carried out by his successor, Ptolemy Euergetes, and added to by Neos Dionysos in the 1st century B.C., when the decorations on the walls were made by Augustus and Tiberius, whose votive offerings in the form of reliefs decorate the exterior, and by Hadrian, who reared a shrine at the west of the main temple. Other buildings are the pavilion of Trajan, a portico of 14 columns; a temple to Hathor, built by Euergetes II and finished by Augustus; the Kiosk; the temple of Harendotes and a shrine of Imhotep. For a full description of the Island consult Bénédict, G. A., 'L'Île de Philé' (Paris 1893); Edwards, A. B., 'A Thousand Miles up the Nile' (London 1877), and Baedeker's 'Egypt.'

PHILANDER, fi-lân'dër, the Dutch knight in Ariosto's 'Orlando Furioso' (1516). He is represented as making love to Gabrina, the wife of his host, and his name has come to be synonymous with masculine coquetry. It was used for the character of the lover in many old plays, and from it came the verb "to philander."

PHILANDER SMITH COLLEGE, at Little Rock, Ark. It was founded in 1877 under the auspices of the Methodist Episcopal Church. The college offers, in addition to the regular collegiate work, a business course, a

normal course and a special music course; there is also a preparatory department. The collegiate work is arranged in two courses, the classical and philosophical, and the degrees of A.B. and B.Ph. are conferred. Women are admitted to all courses. Webb Hall, a new dormitory for girls, was opened in 1915. The grounds and buildings in 1918 were valued at over \$175,000, and the library contained 2,000 volumes. The annual income for 1918 amounted to \$18,000. The students in that year numbered 429 and the faculty 24.

PHILANTHROPY, the impersonal love of humankind based upon the idea of the brotherhood of all men. It is most commonly exhibited by the founding or endowment of public institutions for the organized and systematic relief of the indigent or suffering. In German and Swiss pedagogics the term is applied to the theory of those who advocate Rousseau's plan of education; chief among whom was Basedow (q.v) who founded the first of many Philanthropina at Dessau in 1774. The New York School of Philanthropy, conducted by the Charity Organization of the City of New York, publishes an 'Annual' and a series of 'Bulletins' keeping fully abreast of philanthropic movements. Consult Bolton, S. K., 'Famous Givers and Their Gifts' (New York 1896); Goodale, F. A., 'The Literature of Philanthropy' (New York 1893); Hodges, G., 'Efficient Philanthropy' (New York 1911).

PHILARET, фѣ-ла-рѣт' (VASILI DROSDOV), Russian prelate: b. near Moscow, 26 Dec. 1782; d. Moscow, 1 Dec. 1867. He was ordained priest and in 1812 became rector of the Alexander Nevski Academy at Saint Petersburg. In 1817 he was made bishop of Reval; in 1819 archbishop of Tyer; in 1820 archbishop of Yaroslav; in 1821 archbishop of Moscow, and metropolitan of Moscow in 1826. He was an eloquent orator and long one of the most influential of the Greek clergy. His catechism has been used by all the orthodox clergy and in all the schools in Russia since its publication in 1837.

PHILASTER, or **LOVE LIES A-BLEEDING**. Beaumont and Fletcher, the courtly pair, who, though writing together only some six or seven plays, gave their joint names to a vastly greater output, had most of Shakespeare's secondary virtues. In the handling of plot and situation and character they had all of his theatrical skill; in poesy they had much of his grace and vigor. But they lacked his genius for truth. They carried playwriting out of the domains of life into the regions of convention. 'Philaster' is one of the best examples of that class of tragi-comedy invented for the purpose of appealing to the sensibilities without wringing them with true tragedy. The situation is built up by painstaking artifices to reach a moment of artificial tensity. At any moment "all these jealousies had flown to nothing" had a word been spoken, but the word is not spoken until the authors are ready for it. The authors are no less adept at providing a solution than they are in creating the situation. In this case a tragic dénouement is avoided by the introduction of a crowd as god outside the mechanism and by an opportune confession.

The play itself must be read in the light of the romantic love-comedies of Shakespeare,

the materials of which it uses and develops for theatrical effect. The figure of the girl dressed as page and serving as love-tribune of the man she loves comes direct from Shakespeare, as also do the woodland scenes. 'Philaster' is "a weakened adaptation of Hamlet." And yet between the two there is the difference between stylish embroidery in the "vogue" and the first spirited imagining of the pattern. English dramatic poesy has never gone beyond the flexibility and piteous music of the lines of 'Philaster'; the combined verse and prose are handled with perfect grace. The atmosphere of playful unreality is skilfully maintained "Tis but a bit of childhood thrown away." 'Philaster' was first acted about 1608 at the Globe Theatre and later at the Blackfriars. It was first printed in 1620, after Beaumont's death, which occurred in 1616, under the names of both authors. The plot is original with the writers. The play was very popular, being played after the Restoration, when according to Dryden its authors were more popular than Shakespeare. In adapted form it held the stage until the early 19th century.

THOMAS H. DICKINSON.

PHILATELIC ASSOCIATIONS, American, various associations in the United States devoted to the study of philately or the science of postage stamps. There are local societies in the larger cities and a national association organized in 1885. The New York City association has a club house and a large and valuable library, and publishes monthly *The American Philatelist*. See **PHILATELY**.

PHILATELIC SOCIETY, The London, an association founded in London in 1869, for the study of postage stamps. The Society publishes the *Monthly Journal of Philately*.

PHILATELY, фѣ-ла-тѣ-лѣ, a term embracing the collecting and study of the postage stamps of all nations and the trade which has resulted therefrom. The beginning of this diversion or pastime, as it was in the early days, dates about 1850. It has since developed into a recognized pursuit comparable with the collecting of curios generally. The word philatelist comes from the Greek *philos*, a friend or admirer, and *ateleia*, exemption from taxation. Taxation at the time it derived its name in Greek was represented by a small printed piece of paper or check used as a postage stamp is now used. Primarily philately is an intellectual pursuit. It connotes geography, history, art and science, and stimulates research in many directions. Postage-stamp collecting has been visited with more or less ridicule, but has steadily held its devotees by its unquestionable fasci-

nation, and once aroused the collector's interest never wanes.

Postage stamps generally bear upon their face the effigy of the reigning king or prince, or the national arms, or various other attributes of sovereignty, or the likenesses of men who have made history for their country. The various alterations to which stamps of a country have been subjected during the passing years have furnished in many instances records of political or dynastical movements of certain states or countries. History is accurately depicted in the stamps bearing portraits of rulers. There have been issued for Great Britain and her colonies over 1,325 stamps of different designs and value, bearing the portrait of Queen Victoria. The stamps of some other countries are embellished by numerals, heraldic devices and arabesques, the latter emanating from Mohammedan lands. Others bear the figures of gods and goddesses and various devices, thus enabling the collector to tell whence they come. The collector can trace the changes of governments, kingdoms and empires that have become republics, and republics that have provisional government regencies, insurrections, rebellions and confederacies. Upon the simple postage stamp can be studied the rise, decline and fall of empires. The displacement of the stamps of the Roman states, of the Church and the kingdom of Naples, tells of the establishment of the kingdom of Italy. The disappearance of the Confederate stamps from circulation told of the close of the Civil War. The absence from circulation of the beautiful stamps of New Brunswick and Nova Scotia heralded the fact of the confederation of these provinces under the Dominion of Canada. The rise of the German Empire made obsolete various continental stamps as well as those of Alsace and Lorraine. In other instances old stamps have been superseded by stamps of newer design, but the majority of obsolete stamps have been set aside by external forces and thus illustrate history and political geography. The more recent rise and rapid progress of Japan is noticed by a series of stamps engraved by native artists and printed upon paper of native manufacture.

The 5-cent stamp of the United States first issued bears the face of one of the heroes of the Mexican War. Inadvertently, the collector is led to inquire into the history of the war, and in a short time learns the relation existing between Mexico and other countries. He learns that Spain was known to the Romans as Hispania, that France was known as Gallia and what now comprises the Ottoman Empire was formerly a group of provinces of Greece and Rome. He must know where each stamp-issuing country is located and by what government it is ruled, in order to understand and classify his stamps properly, and in the chronological order of their issue. The relation philately bears to the study of languages is important. Native letters and Arabic numerals are found upon the stamps of many countries, including Montenegro, Bulgaria, Serbia and Russia. There are countries employing both native and Roman letters and numerals, such as China and Japan, Egypt and Turkey, and some of the native Indian and Oriental states. The first serious collecting of postage stamps, began about 1854-55, and was chiefly geographical, taking the

form of arranging on a large sheet a single specimen from each of as many different foreign countries as were obtainable. About 1860 exchanges began to be conducted between boy-collectors, who met in the London streets—at first in Birchin lane—with their duplicates. A year or two later these "exchanges" were dignified by the attendance of adult collectors of both sexes, some of them of notable position, who entered into the trading with such earnestness that the police not infrequently dispersed the crowd. There was similar trading in other cities of Europe, and out of these exchanges grew the dealers' shops and a lively and profitable business sprang up. Ardent collectors began to issue pamphlets on the subject, more or less valuable according to their research and means of information. From this beginning the pursuit has expanded to very considerable proportions; and as the number of specimens extant of the older issues is, of course, limited, and the demand by new collectors is continually increasing, the acquisition of rare stamps has become a matter of keen rivalry, in which the prices of such specimens has gone to astonishing figures. Perhaps the record price paid for specimen stamps was reached in England a few years ago when a fine pair of Mauritius "Post Office" stamps brought \$17,150. There are now about 750,000 collectors scattered throughout the world in about the following proportions: United States, above 150,000; Canada, above 30,000; South America, 4,000 to 5,000; Great Britain, above 120,000; France and Belgium, above 90,000; Germany, above 50,000; Austria, above 30,000; Italy, above 6,000; Spain and Portugal, above 4,000; Switzerland, above 6,000; all other European countries, above 30,000; Asia, above 1,500; Africa, 1,000 to 1,500; Australia, 2,000 to 3,000; West Indies, above 600; countries and colonies not included in the above list, about 1,000.

Among prominent philatelists are kings, queens, presidents, financiers and men of affairs. There are many private collections valued at from \$10,000 to \$100,000, and the Rothschild collection is said to be worth \$175,000. One of the most valuable is the former collection of Mr. Tapling now belonging through his bequest to the British Museum. It has more than 100,000 specimens of stamps and postal stationery and is valued at \$500,000. It is the best in England and the third in value in the world. There are other than philatelists proper who collect stamps. A great many artists gather the more beautiful specimens to study designs. These are also very valuable guides in the matter of engraving on tinted paper. The stamps of the French Republic are masterpieces in this respect. Until they appeared, it was never thought possible to give such effects in engraving on tints. The engraving companies now have in many instances beautiful collections of stamps, but they are, of course, of the uncanceled specimens.

The American Philatelic Association has nearly 2,000 members scattered throughout all the States of the Union. The members in New York City are among the representative men of the country. Among them may be found clergymen, physicians, lawyers, merchants and stock-brokers, there being some 20 members of the New York Stock Exchange in the association. In addition to the parent association

there are branch societies in nearly all the large cities of the United States.

The first sale of postage stamps by public auction took place in London 18 March 1872.

Confederate States Provisional Stamps.

The catalogue comprises some 275 specimens, and the time consumed by the sale was about four and one-half hours.

Among the rare American stamps highly prized by collectors are the early United States provisionals, issued in 1845. The government, being unwilling to undertake the expense of a general issue of postage stamps, permitted the postmasters of certain towns and cities to issue stamps at their own expense and for their own convenience. The postmasters of Alexandria, Va., Brattleboro, Vt., Baltimore, Md., New Haven, Conn., New York, N. Y., Providence, R. I., and Saint Louis, Mo., adopted the plan with such success that the government undertook in 1847 a general issue. Other rare stamps are the Confederate provisionals issued during the Civil War by the postmasters in several Southern cities. These stamps were superseded by the regular issue of the Confederate government.

The philatelist collects not only postage stamps, but revenue, telegraph and express stamps, now long since obsolete. The internal revenue stamps formerly used on proprietary articles were of varied design. There was a common stamp for them just as there is now for tobacco. But under the law any manufacturer who was willing to bear the additional expense of preparing a special die and the further cost, if any, of printing stamps after his own design, could have special stamps printed for him at the government bureau. Many of the proprietors of well-known articles, particularly patent medicines, availed themselves of the privilege because of the prestige and advertising which it carried. A unique branch of philately is that of State revenue stamps. These stamps, which are exceedingly rare, represent the tax imposed upon the citizens by the State government in addition to a regular tax imposed by the United States government. Only a few States have ever issued revenue stamps. They are Alabama, California, Louisiana, Oregon and Nevada. Those of Alabama have arms

in the centre and are printed in vermilion, red and dark blue. Their values are \$1 and \$2. Telegraph and express stamps are much prized by collectors on account of their extreme rarity. They are not issued by governments, but by private corporations, and are both stamps and franks.

Second only in importance to stamps themselves is the literature relating to them, and the collector who desires to keep abreast with the latest developments in matters pertaining to stamp collecting must devote considerable time, space and money to his philatelic library. The most rapid growth in this line has occurred within recent years. About 1863 the first journal devoted to the "literature" of postage stamps appeared in Belgium. It was a monthly publication, *Le Timbre Poste*. The first stamp paper started in the United States was the *Philatelic Journal of America*. Philatelic papers are published most numerous in this country, though the highest class of them come from foreign lands. Among the countries that contribute liberally to philatelic literature, outside of the United States, are England, Germany, France, Belgium, Italy, Austria, Spain, Switzerland, Denmark, Mexico, Brazil, Argentine Republic, Chile and Peru, one or more papers being issued from each of these. But more important and desirable to the collector than all the regular philatelic publications are the catalogues, giving a list of all the stamps ever issued and the current prices of most of them. The cash values of the rarer stamps are established by the prices they bring at auction sales. The great values of some of these have led to the production of clever counterfeits and some notable frauds have been perpetrated. Up to a recent date there was but one American catalogue that was generally accepted by collectors and dealers alike, but now there are several catalogues issued in the United States by different houses, all of which are much fuller and more comprehensive than any heretofore published. The catalogues issued by English, German and French dealers are also utilized to some extent in this country as the basis of valuation, as they are usually more correct as to the actual market value of foreign stamps. Handbooks play no small part in a philatelic library. They are usually the production of a student of the stamps of some particular country and the exhaustiveness with which the subject is entered into indicates a marvelous amount of patience and research on the part of the author. These monographs are in demand chiefly by advanced collectors and specialists.

Stringent laws have been passed by the United States and other countries prohibiting under penalty of fine and imprisonment the making in any manner of facsimiles of the regular issues of postage or revenue stamps. These laws prevent also the printing or publishing of facsimiles of government stamps in books, newspapers, periodicals or other publications, as a protection against counterfeiting. Governments, however, the world around have not hesitated to cater to the stamp collectors by special issues of stamps to commemorate expositions or historic celebrations and the profits made on the sales of stamps which never carry any mail are very large. In some of the smaller countries new issues of stamps are much more frequent because of the army of collec-

tors who may be depended upon to absorb a considerable value far beyond the postal needs of the country itself. (See POST AND POSTAL SERVICE). Consult Burroughs, W. D., *The Wonderland of Stamps* (New York 1910); Creeke, A. B., *'Stamp-Collecting: A Guide for Beginners'* (London 1914); Linn's *'Philatelic Handbooks'*—on United States stamps (Columbus, Ohio, 1913-14); Melville, F. J., *'All about Postage Stamps'* (London 1913); Nankivell, E. J., *'Stamp Collecting as a Pastime'* (London 1902); Power, E. B. L., *'The General Issues of United States Stamps'* (New York 1909).

PHILBRICK, John Dudley, American educator: b. Deerfield, N. H., 1818; d. 1886. In 1842 he was graduated at Dartmouth College and from 1843 to 1853 was engaged as a teacher in Boston. He was nominated principal of the Connecticut Normal School in 1853 and two years later was made superintendent of schools of Connecticut. In 1857-74 and in 1876-78 Mr. Philbrick was superintendent of the public schools of Boston. He attended the Vienna exposition of 1873 as educational representative of Massachusetts. Subsequently he was president of the National Teachers' Association. He wrote *'City School Systems in the United States'* (published by the United States Bureau of Education, Washington 1885) and edited the *Massachusetts Teacher* and the *Connecticut Common School Journal*.

PHILEMON, fi-lē'mōn, Greek comic poet, the son of Damon: b. Soli, Cilicia, about 360 B.C.; d. 262. He became a citizen of Athens before 330 B.C., and is credited with 53 comedies, some of which may have been written by his son. Of these only fragmentary quotations, mostly from Stobæus, remain (ed. in Kock, *'Comicorum Atticorum Fragmenta,'* 1884). Philemon flourished in the reign of Alexander and was a contemporary of Menander, though preceding him by eight years and outliving him by many. He is called the first poet of the New Comedy, the first example of this school being Philemon's play *'Hypobolimeus.'* An idea of his wit, which was ranked above that of Menander in his own day, although Menander was called the greater poet, may be obtained from Plautus' imitations of the *'Mercator,'* *'Trinummus'* and *'Mostellaria'* of Philemon's *'Emporus,'* *'Thesaurus'* and *'Phasma.'* Consult Meineke, A., *'Menandri et Philemonis Reliquiæ'* (Berlin 1840).

PHILEMON, Epistle to. The little letter of Paul to Philemon is the only private letter of the Apostle which has been preserved, although doubtless he wrote many which have perished. We gather from it, compared with Colossians, that Philemon was a prominent member of the church at Colossæ, presumably wealthy, and certainly favorably known for his kindness and hospitality. A slave of his, Onesimus by name, had stolen from him and run away to Rome. Brought in some way in relations with Paul, he had become converted, a thoroughly changed man. Although Paul had not only found him useful but had learned to love him as well, yet it was his duty to return to his master whom he had wronged, and accordingly when the departure of Tychicus for Colossæ gave an opportunity, Paul sent Onesimus with him and wrote this letter to ensure for him kind treatment, since, as should

be remembered, the law set no limits to the punishment which an angered master might inflict. The letter has long been regarded as a masterpiece of tact. After the usual greetings Paul praises the Christian character of Philemon about which Paul had heard, and then turns to make a most winning appeal for Onesimus, in the past unworthy but now useful, as he assures Philemon in an untranslatable play on the name, urging his master to receive him as a brother in the Lord. Paul even offers to make good to Philemon any loss which he might have suffered through Onesimus, at the same time reminding Philemon of his obligations to himself, and holds out hope that he may soon visit him. This inimitable letter is now accepted with practical unanimity by critics of all schools as a genuine Pauline Epistle, written from Rome at the same time with the Epistle to the Colossians. (See COLOSSIANS, EPISTLE TO.) Too much can scarcely be said of the temper, the skill, the beauty with which Paul handled the situation so difficult at that time. Sabatier said: "We have here only a few familiar lines, but so full of grace, of salt, of serious and trustful affection, that this short epistle gleams like pearl of the most exquisite purity in the treasure of the New Testament," and Renan said "Only Paul could have written this little masterpiece of the art of letter-writing."

Professor of New Testament Interpretation,
Colgate University.

PHILEMON AND BAUCIS, bâ'sis, in Greek mythology, a couple celebrated for their faithful affection even in advanced age. Jupiter and Mercury in human form traveling through Phrygia found no one willing to entertain them except this aged couple, who received them hospitably, washed their feet, set before them a rustic meal and prepared a couch for their repose. The deities then took their hosts to a neighboring mountain, and when they looked behind them they saw their village sunk beneath the waves of an inundation; but the cottage in which they had welcomed the pilgrims had become a magnificent temple. Jupiter promised also to fulfil all their wishes; but they only asked that they might die together as servants in that temple. At length, at a very advanced age, as they sat at the temple door they were transformed, Philemon into an oak and Baucis into a linden. They were conscious of their change, which came gradually upon them, and while they were able to see and speak they took the most affectionate leave of each other. The trees were regarded as sacred.

PHILETAS (fi-lē'tas) OF COS, Greek poet and grammarian: b. island of Cos, about 350 B.C.; d. about 290 B.C. He was preceptor to Ptolemy II Philadelphus and is quoted by Theocritus as his model. He was regarded as the earliest of the "grammarians," and was the author of elegies, epigrams and grammatical works which were imitated and much admired by Propertius, and as a poet was ranked by the Alexandrian critics second only to Callimachus.

Fragments of his poems still in existence were collected and published in 1829. Consult Couat, A. H., 'La Poésie Alexandrine' (Paris 1882); Weber, 'Elegische Dichter der Hellenen' (1826).

PHILHARMONIC SOCIETIES, are organizations for the cultivation of orchestral music, and are generally found in all large cities. The London society, founded in 1813, has not only produced many works by British composers, but has also brought to England several great foreign composers to conduct at its concerts. Among these are Cherubini (1815), Spohr (1820 and 1843), Weber (1826), Mendelssohn (1829, 1842, 1844, 1847), Wagner (1855) and Gounod (1871), some of whom wrote works expressly for the society. Beethoven's great ninth symphony was written for the London society and its timely aid helped to soothe the sadness of the great composer's last hours. Among its regular conductors have been most of the best known of English 19th century musicians. The Society has an extensive library dating back to the year of its organization. It contains orchestral parts of the principal works of the classic composers sufficient to fit out a full orchestra; and many priceless manuscripts and original scores autographed by eminent composers. The Philharmonic Society of New York is the oldest organized orchestra in the United States. It was founded in 1842, and its first concert was given on 7 December of that year. Among its conductors have been Bergman, Damrosch, Thomas, Seidl, Paur and Walter Damrosch (1902). The orchestra numbers about 110 performers. There are similar organizations in Vienna, Berlin, Boston, Philadelphia, Pittsburgh, Chicago, Brooklyn (N. Y.) and other cities. Consult Hogarth, G., 'The Philharmonic Society of London' (London 1862); Hunker, J. G., 'Philharmonic Society of New York; A Retrospect' (New York 1917).

PHILHELLENES, *fil-hél'enz* (Greek, *philhellén*), a term employed to designate those who were friendly to the Greeks in their struggle for independence in the first third of the 19th century. Their sympathies were aroused by the realization that the cause of the Greeks was in fact that of civilization as opposed to barbarism. They were of all nationalities, Lord Byron being one of the most noted, and associations of Philhellenes occupied themselves in collecting resources in aid of the struggling Greeks. As these associations multiplied they came gradually to serve as an excuse for political movements of far-reaching importance.

PHILIDOR, *fil'i-dôr*, the assumed name of the Danican family, of which the most illustrious member was FRANÇOIS ANDRÉ DANICAN, French musician and chess expert: b. Dreux, 7 Sept. 1726; d. London, 30 Aug. 1795. He became a page and then choir-boy in the royal chapel, in which capacity he received instruction in music from the eminent André Campra. For some time he devoted himself to the teaching of music, but dissatisfied with the rewards he turned to chess-playing in which he was already locally famous as an amateur. By the time he was 18 years old he was supporting himself by his playing. In 1745 he started on a tour, traveling in Holland, England and Germany as a chess player.

While in England, where he played three blind-fold games simultaneously, he wrote a book on the game, which was published there in 1749, and in an enlarged form in Paris in 1777. His musical friends in France, mourning his loss to their art, finally persuaded him to abandon his chess performances, and in 1754 he returned to Paris, where he wrote several successful comic operas. The first of these, 'Blaise le Savetier,' was performed in 1759 and brought him immediate popularity. Among the many scores which followed from his pen may be mentioned as of unusual interest 'Le Maréchal' (1761); 'Le Sorcier' (1764), and 'Tom Jones' (1765). He wrote also several original and able tragic operas, 'Ernelinde' (1767) being the best known, and various religious compositions. His 'Analyse du Jeu des Echecs' (1777) was long an authoritative work on chess. Consult Allen, G., 'The Life of Philidor' (Philadelphia 1864).

PHILINTE, *fi-lânt*, a character in Molière's 'Misanthrope' (1666). His easy-going tolerance of the faults of others due to his recognition of the impossibility of reforming them makes him a strong foil to the impatient hero Alceste, his intimate friend.

PHILIP (MARCUS JULIUS PHILIPPUS), styled "the Arabian," Roman emperor: b. Arabia, about 204; d. 249. He entered the Roman military service and became Prætorian prefect 243. The Emperor Gordian was forced to receive him as a colleague on the throne by the soldiers who had conquered Sapor, king of Persia, and who had found Gordian immature. In 244 Philip put his rival to death and became sole emperor. In 248 he celebrated the thousandth anniversary of the founding of Rome by a remarkable exhibition of the secular games. He was killed in battle by the soldiers of Decius. He has been called by certain writers the "first Christian emperor," but this is not borne out by facts; as, witness, the accounts of the anniversary celebration. He is, however, credited with exercising a powerful check on the licentious vices of Rome, and the title may have been applied upon this ground.

PHILIP I (Fr. *fê-lêp*), "the Fair," king of France, son of Henry I and Anne of Russia: b. 1052; d. 29 July 1108. He was crowned at Rheims in 1059, ruling for a year jointly with his father, upon whose death in 1060 he succeeded to the throne. For seven years he ruled under the regency of his mother and later of his uncle, Baldwin V of Flanders. When the latter died, in 1067, Philip, though but 15 years of age, assumed the government. His reign was troubled by frequent contests between his great feudatories. He was defeated by Robert the Frisian in 1071, but in 1075 he defeated William I of England, Duke of Normandy. In spite of all difficulties, however, he succeeded in greatly extending his domain. He married Bertha of Holland in 1071, and though a son was born to them in 1081, who later became Louis VI, he repudiated his wife and lived openly with Bertrada, Countess of Anjou. Both were excommunicated. In 1095, a year after Bertha's death, he was excommunicated for the second time, and in 1100 was forced by the legates of Paschal II to acknowledge his son Louis VI coregent. The ban of excommunication was removed in 1104 by Paschal upon

his promise of reform; a promise which he failed to keep, however.

PHILIP II, or PHILIP AUGUSTUS, king of France, son of Louis VII; b. Gonesee, near Paris, 21 Aug. 1165; d. Mantes, 14 July 1223. He was crowned in 1179, becoming co-regent with his father; and a year later succeeded him. He persecuted the Jews, driving them in 1182 from the country, and profited by Henry II's quarrels with his children to force the English king to do him homage for his continental fiefs, by declaring war against him. He undertook the third Crusade with Richard I of England in 1190, but the two kings quarreled after the capture of Acre in 1191, and Philip returned to France, intrigued with the German emperor to imprison Richard on his way home, made an alliance with John, whom he had assisted to the English throne, and, in spite of this, invaded Normandy. From 1194 to 1199 he made war on Richard, and upon his death in the latter year renewed his quarrel with John. A nephew of both Richard and John, Arthur of Brittany, claimed the crown from John, at Philip's instigation, but was seized and killed by the English king, who as Philip's vassal was condemned for this crime to lose his continental fiefs of Normandy, Maine, Touraine and Anjou. Only a part of Guyenne remained in the possession of the English. Philip then prepared to invade England, but was frustrated by the Pope, to whom John had become subservient. John formed an alliance first with Ferrand of Portugal, Count of Flanders, and then with Otto IV of Germany, only to be defeated by Philip's splendid military organization at Bouvines in 1214, the foundation of the continental greatness of the French kingdom. During John's struggle with the rebellious nobles Philip assisted them and put his son Louis forward as a claimant to the English throne. His internal policy was no less active; the Crown was made more powerful by a reformed system of administration; papal influence in France was obstinately combatted; the feudal system made subservient to the king; and in Paris he aided in the building of the first Louvre and Notre Dame, and in the foundation of the university. Philip married Isabella of Hainault, who died in 1190; then Ingeburga, daughter of Walde-mar of Denmark, whom he repudiated in less than three months (1193); and in June 1196 Agnes of Meranie (in the Tyrol). This marriage was declared null by the Pope and Philip was forced to receive Ingeburga again. Agnes died in 1201; her children were legitimized by the Pope. Philip was the ablest of the Capetian kings of France. Consult *Cape-figure*, J. B. H. R., 'Histoire de Philippe-Auguste' (4 vols., Paris 1829); *Delisle*, L. V., 'Catalogue des Actes de Philippe-Auguste' (Paris 1856), and *Cartellieri*, A., 'Philipp II. August' (Leipzig 1913); *Hutton*, W. H., 'Philip Augustus' (London 1896).

PHILIP III, king of France, called **LE HARDI**, 'The Bold': b. Poissy, 3 April 1245; d. Perpignan, 5 Oct. 1285. Upon the death of his father, Louis IX, in 1270 at the camp before Tunis, Philip was proclaimed king. In 1271 he inherited from his uncle Alphonse, Count of Poitou and Toulouse, much of Languedoc; was under the influence of Pierre de la Brosse, his

barber, whom he afterward made the court chamberlain, until 1274 when he married Marie of Brabant, who ruled the king thereafter. In 1279 Edward I of England ceded to him the whole of Normandy. In 1285 he undertook to punish Peter III of Aragon for the massacre known as the Sicilian Vespers (q.v.). He died on his way home after an unsuccessful campaign. Consult *Langlois*, C. V., 'Le Règne de Philippe le Hardi' (Paris 1887).

PHILIP IV, king of France, called **LE BEL**, 'The Fair,' son of the preceding; b. Fontainebleau, 1268; d. 29 Nov. 1314. He came to the throne in 1285, was crowned at Rheims 6 Jan. 1286, and began his reign with Champagne and Brie as appanages, thanks to his marriage (1284) with Johanna of Navarre. Guyenne he won from Edward I of England in 1294 only to restore it in 1299, when he gained the most of Aquitaine. Almost immediately afterward he occupied Flanders, but ruled there so cruelly as to arouse a great revolt under the leadership of the weaver Peter de Koninck. The French nobles were terribly beaten by these Flemings at Courtrai (Kortrijk) 11 July 1302, the "Day of Spurs," after which 4,000 gilt spurs were hung as trophies in Courtrai cathedral. Two years later Philip made peace with Flanders, giving up his title to the country. The subjection of Lyons to the Crown (1312) was his last and most important addition to the royal territory. But neither temporal strife nor territorial change is the most important event of Philip's reign. His relations with the papacy and his internal and financial policy are the two things that mark out Philip's rule—if not Philip's self, for it is impossible to decide how far his personality was a factor in diplomacy or administration; contemporary mention of him gives no hint of any vigor, force or ability, whereas modern historians are loath to describe the far-reaching events of his reign without intimating that they were primarily the result of his own definite policy. His break with Boniface VIII, whether due to the king or to his civil juriconsults, began in the early years of Philip's reign, when the Pope attempted to bring Philip and Edward of England to a peaceable understanding. In 1296 the Pope issued a bull excommunicating Philip, and bidding the clergy pay no taxes to the Crown or any other temporality without papal consent, under pains of the ban. An apparent reconciliation took place in 1297, but three years afterward the Pope's legate to France was arrested by the king on the charge (speciously trumped up) of treason, specifically of rousing the people to revolt. In the following year Philip and the French kingdom were interdicted by papal ban. This bull Philip openly burned. The counter-move was sharp and decisive; Nogaret, Philip's greatest lawyer-diplomat, in 1303, with the help of the Colonne, seized the person of the Pope, who died soon after (1304). Moreover, Philip succeeded in electing the bishop of Bordeaux, Bertrand de Goth, as Pope Clement V, and in keeping the curia out of Rome and in Avignon, the beginning of the "Great Captivity," during which the papacy was under French control for 70 years. The internal administration of Philip was significant in that fresh and cruel taxes were levied, the Jews (1306) and Lombards (1311) persecuted for their wealth, and the

coinage of the realm debased. In 1307 he had attacked the Templars, seizing and executing their grand master and the principal knights, and confiscating their property. Consult Boutaric, *'La France sous Philippe le Bel'* (1869); Renan, *'Etudes sur la Politique religieuse du Règne de Philippe le Bel'* (1899).

PHILIP V (LE LONG, lè löng), "the Tall," king of France, son of Philip IV: b. about 1294; d. 3 Jan. 1322. Upon the death of his brother, Louis X, he became regent; and after a few months succeeded to the throne in 1316 by virtue of the Salic law which excluded the daughter of his brother. In 1317 Philip settled the dispute with Flanders, acquiring additional territory, and throughout his reign endeavored to make various reforms, but was usually thwarted by the States-General. In 1320 a cruel persecution against the Jews was begun. Philip's death occurred in the midst of it. Consult Lehuëur, P., *'Histoire Philippe V le Long'* (Paris 1897).

PHILIP VI, "the Fortunate," king of France, brother of Philip "the Fair," and son of Charles, Count of Valois, hence founder of the house of Valois and therefore styled **PHILIP OF VALOIS**: b. 1293; d. Nogent-le-Roi, 22 Aug. 1350. He was grandson of Philip III le Hardy (q.v.), and had shown himself an able soldier before he became count, 16 Dec. 1325, and as count a fiery feudal lord. On the death of his cousin, Charles IV, he was named regent, and his claim to the throne was preferred by the second application of the Salic law (the first in 1317, when Philip V came to the throne) to that of the posthumous infant daughter of Charles, and he was made king, April 1328. The claim of Philip was admitted in 1330 by Edward III of England who had himself laid claim to the throne of France through his mother, daughter of Philip IV. Putting himself at the head of the nobles, who were eager to take vengeance on the Flemish for the defeat of Courtrai, the king won the battle of Cassel, 23 Aug. 1328, and made Flanders a French county. Philip's interference in Scotland, his attempt to close Flanders to English merchants, and a story that he had become Count of Valois by trickery, and so king of France, prompted Edward III of England to reconsider his acquiescence in Philip's accession to the throne, and he claimed the French crown for himself as son of Isabelle, sister of Charles IV (in spite of the Salic law). In 1337 the Hundred Years' War broke out. Its main events occurring in this reign are the defeat of Philip's fleet at Sluys (1340), which laid the foundation of British supremacy in the Channel, and the loss of the great battle of Crécy (1346) and of 30,000 of the flower of the French nobility at Calais (1347). Edward challenged him to a duel, but he declined. The terrible Black Death devastated France during the last years of Philip's life. His reign, though the source of so much mediate loss to France, was not without territorial gain; Valois, of course, came to the Crown; Champagne and Brie were ceded by Philippe d'Ébreux; and Montpellier and Dauphiny were bought. Philip VI was succeeded by his son John II, called "The Good." Consult Gaillard, G. H., *'Histoire de la Querelle de Philippe de Valois et d'Édouard III'* (Paris 1819), and Longman, W., *'Life and Times of Edward the Third'* (London 1869).

PHILIP II, king of Macedon: b. Pella, 382 B.C.; d. 336 B.C. He was the youngest son of Amyntas II, and obtained at Thebes a careful education, gaining knowledge of military institutions and statecraft from Epaminondas (q.v.), the victor of Leuctra, and familiarizing himself also with the intellectual culture of the Greeks. He was later regarded as an orator of considerable ability. On the death of his brother Perdiccas II (359 B.C.), he became the supreme ruler of Macedonia as guardian of his nephew Amyntas, whom he soon set aside in order to assume for himself the regal title. At that time Macedonia was in very real danger. Pausanias, a pretender who had been expelled from the kingdom, and Argæus, who had once held the throne for two years while Amyntas II was a fugitive in Thessaly, now asserted claims to the royal power. The Pæonians were making attacks at the north, the Illyrians on the west. Philip reorganized the army, increasing its efficiency by the invention of the well-known Macedonian phalanx, a compact mass protected by round shields and bristling with long spears. In a year he had completely freed himself from his enemies, and having thus made his small domains secure proceeded to enter upon that career of aggrandizement which extended Macedonian sway over Greece, and was aimed to include Persia also. There were then three powers upon the position of which his success depended. These were Amphipolis, a city at the mouth of the Strymon, once a colony of Athens, but later successful in revolt; Olynthus, the strongest town of the Thracian Peninsula; and Athens. Philip agreed in secret negotiations with Athens to restore Amphipolis on condition of being given control of Pydna, the latter having a harbor on the Thermaic gulf, then commanded by Athens. He captured Amphipolis (358 B.C.), and then marched on Pydna, the easy conquest of which by his own forces and not through Athenian aid afforded a pretext for refusing to keep his agreement. He prevented any co-operation between Athens and Olynthus by taking Potidæa from the former and giving it to the latter in 356 B.C. Not long after he took the Thracian settlement of Crenides, which he renamed Philippi, and which was the valuable centre of a gold-mining district. His capture of Methone in 352, after a long siege, gave him the key to Thessaly, where he quickly established his ascendancy. He marched as far south as Thermopylæ, which he found so strongly guarded that he retired. Already, in 352, Demosthenes (q.v.), in his first philippic, had endeavored to arouse Athens to a sense of its danger. Philip conquered Thrace, by 347 was in possession of all the Chalcidian cities, and in that year took Olynthus, which had received tardy and ineffectual assistance from Athens, with whom Philip concluded peace in 346. He then entered Phocis, destroyed the Phocian cities and had their place in the Amphictyonic Council given to himself. His Hellenic influence was further conceded by his joint appointment with the Thessalians and Thebans to the presidency of the Pythian games. In 340 he began the siege of Byzantium and Perinthus, but Athens, finally alarmed, sent aid under Phocion, who in 339 compelled Philip to raise the siege of both towns. Philip now seemed to turn his attention to the peoples of the north; but his agents were busy compassing his designs. The Amphictyonic

Council declared war in 339 against the Locrians of Amphissa for having seized part of the sacred territory, but the commander of the army sent accomplished nothing. In 337, therefore, Philip was appointed general. He marched through Thermopylæ, and took Elatea. Again Demosthenes thundered; the Athenians were aroused and formed an alliance with Thebes. But the combined army was defeated by Philip at Chæronea (August 338). Thus ended the independence of Greece. Athens was treated with leniency, but Thebes resisted and fared hardly. The invasion of Persia was now within reach. A congress was held at Corinth, to which all the states of Greece but Sparta were invited. At this congress the war with Persia was determined on, and Philip appointed commander of the confederate forces. In 336 B.C. he celebrated with great pomp the marriage of his daughter Cleopatra with his brother-in-law Alexander of Epirus, by which he hoped to heal this division, but he was assassinated during the feast by a Macedonian youth, Pausanias, who had a private grudge against him. Alexander (q.v.) and his mother Olympias were suspected of complicity in the plot. Philip was a bold and warlike ruler, with the craft which he found necessary if he were to carry out an ambitious foreign policy by means of a small state. He was a patron of art and literature. Consult Leland, J., 'History of the Life and Reign of Philip, King of Macedon' (2 vols., London 1775); and standard histories of Greece. See GREECE, *History*.

PHILIP V, king of Macedon: b. 237; d. Amphipolis, 179 B.C. He was eight years old at the death of his father, and came to the throne in 220 after nine years of capable regency of his uncle, Antigonus Doson. Philip was a general but no statesman. In 217, having joined the Achæan League, he defeated the Ætolians. In order to subdue all Greece he made an alliance with Hannibal against the Romans, who occupied Illyria. In the first Macedonian war (214-205) he accomplished nothing and was forced to a humiliating peace. He still aided Hannibal with supplies, however, and in 200, after the conclusion of the second Punic War, Rome, roused by this fact and by the complaints of Attalus, the Rhodians and the Egyptians made war upon him again. He was successful until Flaminius took command, and then the allied army of Romans and Ætolians completely defeated him at Cynoscephalæ in 197, the end of the second Macedonian War. Macedonia became an ally of Rome; all Philip's alliances and conquests were renounced, and he had to pay a heavy tribute. Perseus, his natural son, succeeded to the throne. Consult Droysen, 'Geschichte des Hellenismus' (1877-78); and Mahaffy, 'Alexander's Empire' (1888).

PHILIP I, king of Spain, surnamed "the Handsome": b. Bruges, 22 July 1478; d. Spain, 25 Sept. 1506. He was the son of Maximilian I, emperor of Germany, and a grandson of Charles the Bold. He became ruler of the Netherlands in 1482, and by his marriage in 1496 with Joanna, daughter of Ferdinand V, king of Aragon, and Isabella, queen of Castile, he obtained the Crown of Castile in 1504. He was the father of the emperors Charles V and Ferdinand I.

PHILIP II, king of Spain, son of the emperor Charles V and Isabella of Portugal: b. Valladolid, 21 May 1527; d. palace of the Escorial, 13 Sept. 1598. He was married in 1543 to Mary of Portugal, who died in 1545 after the birth of Don Carlos; and early showed himself haughty, cold and restrained, so that the purpose of his father to procure for him the imperial election was made impossible by his unpopularity, and in 1551 he returned to Spain after a three years' stay in Germany and assumed the royal duties there, to which he had been accustomed since his 16th year, when upon his father's departure for Germany the boy had become regent with a council headed by the Duke of Alba. Philip married Mary of England in 1554, and the queen, who was 11 years his senior, seems to have been deeply in love with him and was certainly greatly influenced by his advice. But the English climate did not agree with him, and in 1555 he left the country for Brussels, having been appointed governor of the Netherlands and of the Spanish possessions in Italy; on 16 Jan. 1556 his father abdicated the Spanish throne in his favor. His royal policy was "worldwide power for Spain and the Roman Catholic Church," but this did not prevent war with the Neapolitan Pope Paul IV, and the papal ally, the French king, both of whom were defeated. Yet in general Philip's project was in behalf of the defense of the Church, which he regarded as a means to his own ends. With English help he had defeated the French at Saint Quentin, 10 Aug. 1557, and at Gravelines, 13 July 1558, and had made the peace of Chateau Cambresis in April 1559. Upon Mary's death (1558) Philip became one of the many suitors of Elizabeth, her successor, but, learning that her policy was entirely opposed to his, 24 June 1559 married Isabella, daughter of Henry II of France. In the meantime Alba's stern attempts to carry out the policy of maintaining Catholicism in the Netherlands had roused the province to determined rebellion and had annihilated the king's income from Dutch commerce, so that Alba was recalled, and his place taken first by Requesens, then by Philip's brother, Don John, the hero of the wars with the Moors and with the Turks. Don John's want of success was apparently due to the king's refusal of funds as a part of the royal plan to repress this brilliant and popular leader, and he was succeeded by Alexander Farnese. In 1570, after the death of Isabella, Philip married his niece, Anne of Austria, who lived only 10 years and left him one son, the future Philip III. Roused by the widespread assistance offered his rebellious Netherlands, Philip undertook a great scheme of European conquest, claimed and won the throne of Portugal, struck a great blow at the Netherlands by the assassination of William of Orange, and, having made France entirely subject to his policy, in 1588 fitted out the great Armada which was to punish Elizabeth for the execution of Mary of Scotland and to make England a Catholic appanage of Spain. The destruction of this fleet was a terrible calamity to Spain. Troubles with France, where it was only with the greatest difficulty that Philip placed on the throne his daughter Isabella and where Henry of Navarre kept the League in disorder, were followed by the death of Alexander Farnese (1592) and by increased boldness on the part

of English privateers against Spanish shipping, so that the Spanish kingdom was practically ruined at the death of Philip, and largely by his ambitious schemes, whose only success was in the firm foundation of the counter-Reformation. Consult the biographies of Philip by Prescott, Dumesnil, San Miguel and Hume and the rehabilitation by Montaña, 'Nueva luz y juicio verdadero sobre Felipe II' (1882).

PHILIP III, king of Spain: b. Madrid, 14 April 1578; d. there, 31 March 1621. He was the son of Philip II and his fourth wife, Anne of Austria, and succeeded his father in 1598. In the next year he married Princess Margaret of Austria. During his reign the war in the Netherlands continued, his general, Spinola, taking Ostend in 1604 after a three years' siege. Nevertheless Philip was at last obliged to admit the independence of the United Provinces and made a truce with them in 1609. In the same year he expelled the Moors from Spain, a step which accelerated the downfall of Spain's importance. The expelled persons were for the most part valuable citizens,—thrifty traders and farmers—and their departure left entire provinces half depopulated.

PHILIP IV, king of Spain: b. Valladolid, 8 April 1605; d. 17 Sept. 1665. He was the son of Philip III, whom he succeeded in 1621. His first Prime Minister was Olivarez, whose maladministration had proved so calamitous in the previous reign. The war with the Netherlands was renewed, lasting until the Peace of Westphalia, when the independence of the Netherlands was conceded by Spain. Other events of this melancholy reign were the war with France 1635–59; a formidable revolt in Catalonia, suppressed in 1652; the revolt of Portugal in 1640 with a long war ensuing which terminated in the Portuguese victory of Villaviciosa in June 1665. An equestrian portrait of this monarch by Velasquez hangs in the Royal Museum at Madrid and is considered the finest portrait by that artist. A second portrait of Philip IV by Velasquez is in the Louvre at Paris.

PHILIP V, king of Spain, grandson of Louis XIV of France: b. Versailles, 19 Dec. 1683; d. Madrid, 9 July 1746. He was the second son of the Dauphin Louis, who died when the boy was 10; received from Louis XIV the title of Duke of Anjou; and as a direct descendant of Philip II of Spain was named successor to Charles II of Spain in the will of that childless monarch in 1700. To withstand this advance of the Bourbon family and of the personal power of Louis XIV, and to promote the claim of the Archduke Charles of Austria, who was as near the Spanish throne as Philip by ties of blood, England, Holland and Austria formed the Grand Alliance and precipitated the war of the Spanish Succession. (See SPANISH SUCCESSION, WAR OF). His realms suffered by the detachment of his domains in Italy and in the Netherlands, and of Minorca and Gibraltar, but he remained king of Spain. The loss of his wife, Maria Louisa of Savoy, in 1714 deprived him of a wise counselor and put an end to the influence of the Countess of Orsini. He married Elizabeth Farnese of Parma, came under the influence of Alberoni, minister from Parma to Spain, and was hurried into war with France by the scheme to arrange for his children by this second marriage. In 1717 Great

Britain and Holland, and in 1718, Austria, joined France. The Duke of Berwick invaded Spain, and Sardinia was lost as soon as won. Alberoni was dismissed and his place taken by Jesuit advisers. Philip in January 1724 for obscure reasons abdicated in favor of his son Luis, who died in August, so that Philip had to return to power. His mind failed during his last years. Consult Baudrillart, 'Philippe V' (1890); and Coxé, 'Memoirs of the Kings of Spain' (1815).

PHILIP, often called **KING PHILIP**, chief of the Wampanog or Pokanoket tribe of Indians: b. near the beginning of the 17th century; d. 12 Aug. 1676. He was the youngest son of Massasoit (q.v.). In 1662 he became chief and renewed the former treaties with the whites. But suspicion seems from the first to have prevailed on both sides. In 1674 John Sausamon, a "praying Indian," or disciple of John Eliot, reported that Philip was stirring up the tribes against the English. An investigation was made which proved practically nothing, but the colonists were aroused, and the Indians in turn put themselves on the defensive. On 30 June 1675 the first attack was made on the colonists during their return from church. The war was of the most desolating character, the Indians never meeting the enemy in the open field, but rapidly passing from one exposed point to another, burning villages, cutting off by ambuscades detached parties of troops, and shooting down all who strayed outside of the places of protection. Philip also formed an alliance with the powerful tribe of Narragansetts, and in December 1675, 1,000 men under the command of Governor Winslow invaded their territory, stormed a fort in which there were said to have been 4,000 Indians, and utterly destroyed their village with all its stores. The war raged during the first half of 1676 with unabated fury, but the conquest of the Narragansetts and the complete destruction of his own tribe soon left Philip without resources. Deserted by all, he was hunted from spot to spot, and at last, taking refuge at Mount Hope, was there attacked and in attempting to flee was killed by a renegade Indian. Large numbers of the Indians were sold as slaves in the West Indies and South America. During the war, which had lasted a little more than a year, Brookfield, Northfield, and Springfield in the Connecticut Valley, Lancaster, Weymouth, Marlboro, Groton and Medfield in Massachusetts, and Providence and Warwick in Rhode Island, had been destroyed; and many attacks and massacres had taken place. The character of Philip has been variously represented; but it seems plain that the encroachments of the whites were responsible for his desperate outburst, and that, judged by Indian standards, he was a valiant warrior.

PHILIP, John Woodward, American naval officer: b. New York, 26 Aug. 1840; d. Brooklyn, N. Y., 30 June 1900. He entered the United States Naval Academy in 1856, was appointed a midshipman in 1861, served on the *Constitution* and the *Santee* and was promoted in that year to be acting commander of the sloop-of-war *Marion*. In 1862 he received the rank of lieutenant, served on the *Chippewa*, *Pawnee* and the monitor *Montauk* and took an active part in the siege of Charleston, S. C. In 1868 he was promoted lieutenant-commander and served in the Asiatic and European squadrons until

1874 when he was commissioned commander. He was appointed to command the Woodruff scientific expedition round the world in 1877, was lighthouse inspector in 1884-87, received the rank of captain in 1889 and in 1894-97 was in command of the Boston navy yard. In 1897 he was assigned to the command of the battleship *Texas* and played a distinguished part in the battle of Santiago in 1898. In that year he was placed in command of the North Atlantic squadron and in 1899 was promoted rear-admiral in charge of the Brooklyn navy yard, in which command he remained until his death. Consult Mackay, 'Life and Adventures of Jack Philip, Rear-Admiral United States Navy' (1903).

PHILIP, The Adventures of, a novel by W. M. Thackeray, published in 1862. It was a sequel to 'The Shabby Genteel Story' and first appeared serially in the *Cornhill Magazine* (1861-62).

PHILIP THE APOSTLE, the fourth of the 12 Apostles chosen by Jesus Christ. In the synoptical gospels he is merely named on occasion as one of the 12; in the Fourth Gospel he is individualized; there the manner of his call is told. Jesus "found Philip," who "was from Bethsaida" and said to him, "Follow me." He appears to have been a disciple of John the Baptist, and to have been influenced to approach Jesus by Andrew. Immediately after he was himself called he brought to Jesus his companion Nathaniel (called also Bartholomew). Philip is the only one of the apostles who had a Greek name; probably he spoke Greek, as it was to him that "certain Greeks came" to request to be admitted to the presence of Jesus (John xii, 20-22). He is one of the two apostles who alone are named in the narrative of the miracle of the feeding of the 5,000. (John vi, 5-9). Of his life after the apostles went forth on their mission very little is known. According to Theodoret and Eusebius his special field was the two Phrygias. His festival is observed in the Eastern Church on 14 November, in the Latin Church on 1 May.

PHILIP THE BOLD, duke of Burgundy: b. 15 Jan. 1342; d. 27 April 1404. He was the fourth son of John, king of France. He fought at Poitiers (1356), where, according to Froissart, he acquired the surname of the Bold, shared his father's captivity in England, and on his return his father restored for him the Duchy of Burgundy, which he had united irrevocably to the crown, and made him premier peer of France. Philip married in 1369 Margaret, daughter of Louis, Count of Flanders, which gave him on the death of his father-in-law (1384) the counties of Flanders, Artois, Rethel and Nevers, and made him one of the most powerful sovereigns of Europe. Philip served against the English in campaigns in Beauce and Burgundy (1364), before Calais (1369), in Poitou (1372) and Flanders (1377). On the death of Charles V (1380) he became regent with his brothers. His administration in Flanders appears to have been wise and conciliatory. In 1388 the king, Charles VI, took upon himself the administration of the kingdom but in 1392 showed signs of insanity, and Philip resumed the regency, which he retained till his death in 1404.

PHILIP THE EVANGELIST, or **PHILIP THE DEACON**, was with Stephen and five others, all Greeks, chosen by the apostles to administer the economic affairs of the faithful in Jerusalem. After the death of Stephen, Philip went as an evangelist into Samaria, where his ministry was exceedingly fruitful (Acts viii), and where Simon Magus, or Simon the Sorcerer, professed the faith, convinced by Philip's preaching. Other incidents of Philip's life recorded in the same chapter of Acts are, the conversion of the Ethiopian eunuch, and the preaching of the gospel in all the cities of Philistia till he came to Cæsarea. He appears to have fixed his residence there, for several years after, when Paul visited Cæsarea (A.D. 55) he was entertained in the house of Philip, who at that time "had four daughters, virgins, which did prophesy" (Acts xxi). The history of this Philip has been by many ancient writers confounded with that of Philip the Apostle. The Latin Church commemorates Philip the Deacon on 6 June.

PHILIP THE GOOD, duke of Burgundy: b. Dijon, 13 June 1396; d. Bruges, 15 June 1467. He succeeded his father, John the Fearless, on the assassination of the latter in 1419, and at once entered into the Treaty of Arras, by which he recognized Henry V of England as successor to the crown of France. Charles VI concluded with him the Treaty of Troyes (1420), which was accepted by the States-General and the parliament, excluding the Dauphin from the succession and recognizing Henry as administrator of the kingdom and heir to the crown. Both Henry V and Charles VI died in 1422, and Henry VI was then proclaimed king of France. Bedford, who now became regent of France, married Philip's sister. Disputes with the English presently followed and Philip, making his peace with Charles VII, concluded a defensive alliance with him, and declared war on England. He received the Dauphin Louis (see LOUIS XII) at his court, when he quarrelled with his father (1456) and accompanied him to his coronation in 1461. Philip was much beloved by his subjects, and under his rule Burgundy was both prosperous and tranquil. He was succeeded by his son Charles the Bold.

PHILIP THE MAGNANIMOUS, landgrave of Hesse: b. Marburg, 13 Nov. 1504; d. Cassel, 31 March 1567. He was the son of William II, whom he succeeded under the regency of his mother in 1509. He vanquished Franz von Sickingen in 1523, and joined the princes who went out in 1525 to quell the insurrection of the peasants. The same year he issued an edict on the preaching of the gospel and the morality of the clergy, and to aid the success of the new doctrine, formed the League of Torgau with the Elector of Saxony in 1526. At the Diet of Spire he spoke in behalf of the rights of the Lutheran Church. He then expelled the monks from the monasteries and confiscated their revenues to secular purposes. In 1527 he founded the University of Marburg; subscribed the protestation to the Diet of Spire in 1529, and submitted the Confession of Faith at Augsburg in 1530. He was, with the Elector of Saxony in 1531, head of the Schmalkaldic League but was obliged to submit to the Emperor Charles V after the battle of Mülberg (1547). In 1552 he obtained his freedom, and

after his return to his dominions he sent a body of auxiliaries to assist the French Huguenots. With the consent of his wife, Christina, who lived till 1549, and after obtaining the assent of Luther and Melancthon, he in 1540 married Margaret of Saale, usually called the "left landgravine," and had by her six sons and a daughter, an alliance which caused much scandal. Consult Rommel, 'Philip der Grossmüthige Landgraf von Hessen, nebst einem Urkundenbuche' (1830); Ranke, 'History of the Reformation in Germany' (English translation 1845-47).

PHILIP THE MAGNANIMOUS, Order of, an order founded by the Grand-duke Ludwig I of Hesse, 25 Aug. 1807. There are five classes; the decoration is a cross of white enamel, and the motto, "Si Deus nobiscum, quis contra nos?" (If God be with us, who can be against us?).

PHILIP NERI, Saint. See **NERI**, SAINT FELLIPPO DE.

PHILIP OF SWABIA, emperor of the Holy Roman Empire: b. about 1177; d. 21 June 1208. He was the youngest son of Frederick Barbarossa and was educated for the Church, becoming bishop of Würzburg in 1191. He resigned his see the next year and in 1196 succeeded to the dukedom of Swabia. He attempted to obtain the German crown for his infant nephew, Frederick II, but was unsuccessful in this, though himself chosen emperor of the Holy Roman Empire in 1198. He was opposed by the Guef candidate, who was crowned two months before him. Otho was supported by Pope Innocent III, but Philip at last secured the assistance of the archbishop of Cologne and other great rulers and was crowned by the archbishop in 1205. Consult Winkelmann, 'Philipp von Schwaben und Otto IV, von Braunschweig' (1873-78).

PHILIP AND HIS WIFE, a novel by Margaret Deland, published in 1895. The book might well be called a study in selfishness, although its emphasis seems to bear upon marriage and the marriage laws; concerning which the author propounds certain theories and problems, without offering any direct solution. There are some scenes of great dramatic power and the background of village life in southern Pennsylvania is pictured with much charm.

PHILIPP, fê-lêp, Isidor, French pianist: b. Pesth Austria, 1863. He removed to France when very young, was educated in the Conservatory and became one of the most popular Parisian pianists of the day. His appearances in London and Brussels were also very successful. He has made a specialty of classical chamber music and has published editions of classic studies as well as compositions of his own. He was one of the founders of the Société d'Art, of which he afterward became president. Since 1903 he has been a professor in the Conservatoire at Paris.

PHILIPPA (fi-lîp'a) OF HAINAULT, hā-nō', English queen, daughter of William the Good of Holland and Hainault: b. Holland 1314; d. Windsor Castle England 15 Aug. 1369. She was married to Edward III of England by a special papal dispensation in 1328 and was crowned at Westminster in 1330. Her marriage was of political importance, inasmuch as

it strengthened the friendship between England and Flanders, greatly benefiting the commerce of England. She was very popular among her subjects and some authorities credit her with having summoned and harangued the forces which defeated the Scots at Neville's Cross. She was the mother of seven sons and five daughters, her eldest child being Edward the Black Prince.

PHILIPPE DE CHAMPAIGNE, French painter: b. Brussels, 26 May 1602; d. Paris, 12 Aug. 1674. He first appears in history as engaged with Duchesne on the decoration of the Luxembourg Palace at Paris, where he was persecuted by the envy and jealousy of his collaborators and driven back to Brussels (1627), but was recalled by Queen Maria de' Medicis and appointed court painter. He was elected successively member, professor and rector of the Academy. His fame at Paris was, however, soon eclipsed by that of Le Brun, and he retired to Port Royal, where the recovery of his daughter, a nun in that monastery, from severe sickness, gave occasion for the lovely picture now in the Louvre, 'Sister Susanne and Mother Agnes in Prayer.' If the conception of this work lacks clearness and intensity and the composition is not perfect in harmony, there is everything to be found there which study and deftness of handling could supply. The influence of Poussin is plainly discernible in all his works, but he has also all the excellencies of the Dutch school, and is perhaps most successful as a portrait painter. His own portrait, engraved by Edelinck, is in the Louvre, where also may be seen his 'Philip the Apostle'; 'The Last Supper'; 'Incidents from the Life of Saint Gervasius and Protasius'; 'Portrait of Richelieu.' His 'Adam and Eve Weeping Over the Death of Abel' (1656) is in the Imperial Gallery at Vienna. Consult Gazier. 'Philippe et Jean-Baptiste Champaigne' (1893).

PHILIPPEVILLE, fê-lêp-vêl, Algeria, a seaport and the capital of an arrondissement in the department of Constantine; on the Gulf of Stora. It has a fine harbor, protected by two moles, one 1,310 feet long and the other 4,590 feet. The town is modern, a large part of it was built since 1838 on the site of the ancient Rusicada. It has manufactories of cork, leather and also a large distillery. Iron mines and marble quarries are in the vicinity. There is an extensive trade in grain, fruits, tobacco, cotton, cork and leather. Pop. 16,000.

PHILIPPI, fê-lêp-pê, Felix, German dramatist: b. Berlin 1851. He entered journalism and in 1875 removed to Munich, where he wrote for different French and German periodicals, and after 1884 devoted himself to the writing of dramas. His plays are of the realistic type and he is one of Germany's most successful dramatists, his plays having also been successfully presented before German audiences in New York. Among them are 'Der Advokat' (1884); 'Dagmar' (1886); 'Das alte Lied' (1889); 'Wohlthäter der Menschheit' (1895); 'Wer Wars?' (1896), etc.

PHILIPPI, fi-lîp'i, an ancient city of Macedonia, northeast of Amphipolis, now Filibedjik. Originally a Thracian city named Crenides, "the place of springs," it was conquered by Philip II of Macedon, named after him, and exploited

by him because of valuable gold mines in the neighborhood. Here in 42 B.C. the triumvirs, Antony and Octavian (later Augustus), defeated the republican army led by Brutus and Cassius, after a battle in which Brutus defeated the wing commanded by Octavian. Augustus made the city the Roman colony of Julia Augusta Philippi. Saint Paul seems to have visited Philippi twice and to have founded there the church to which he wrote the Epistle to the Philippians (q.v.). The city is now in ruins.

PHILIPPI, Engagement at. Upon the secession of Virginia Governor Letcher ordered Col. George A. Porterfield to proceed to Grafton and organize a command to hold the Baltimore and Ohio Railroad and guard the western frontier of the State against invasion from Ohio. The Union sentiment was strong and Porterfield with difficulty succeeded by 25 May 1861 in raising about 500 infantry and 175 mounted men. Governor Letcher had ordered him to make a descent on Wheeling and burn the bridges of the railroad should the Union troops endeavor to pass over it. The descent on Wheeling was impossible, but on the 25th he burned the railroad bridges between Farmington and Mannington. Gen. George B. McClellan, in command of the Union department of Ohio, including West Virginia, when informed of this ordered his troops to move to the Ohio and four regiments were crossed on the 27th and advanced from Wheeling and Parkersburg by the branch railroads uniting at Grafton. The bridges were repaired and the two columns joined at Grafton on the 30th. Porterfield abandoned Grafton on the 28th, retreating 15 miles south to Philippi, in Tygart's River Valley. Gen. T. A. Morris, with a brigade of Indiana troops, arrived at Grafton on 1 June and was given command of the Union troops in West Virginia. Upon his arrival he found that Col. B. F. Kelley, 1st Virginia (Union) regiment, under instructions from McClellan, had planned an expedition to surprise and capture Porterfield. Morris enlarged it by sending another column, under Col. Dumont, of the 7th Indiana, to co-operate with Kelley. Kelley had about 1,500 men of the 1st Virginia, 9th Indiana and 16th Ohio and Dumont, the 7th Indiana, part of the 6th, 14th Ohio and two guns of Barnett's Ohio artillery. Both columns made a night march, Kelley starting from Thornton and Dumont from Webster, on the railroad and converging on Philippi, which was to be attacked about 4 A.M. of 3 June. Dumont reached the hills overlooking Philippi soon after the appointed time and without waiting for Kelley opened fire with his artillery upon Porterfield's camp, taking it by surprise; in the midst of which Kelley came in from the other direction, but not soon enough to intercept the Confederate retreat. Porterfield, though surprised, by his coolness, courage and energy got his men off with but few casualties and the loss of some public stores and private baggage and retreated in good order to Beverly, some 30 miles southeast, and the Union troops occupied Philippi. Col. Kelley was the only person wounded on the Union side. Three Confederates were wounded, one, J. E. Hagner, by a cannon-ball, necessitating the amputation of a leg, the first amputation of the war. This was the first passage of arms in West Virginia; it greatly elated the Union

men and gave an impetus to the dismemberment of Virginia and the formation of a new State; the secessionists were much depressed.

E. A. CARMAN.

PHILIPPIANS, Epistle to. Authorship.

—That Paul wrote the Epistle to the Philippians is now asserted or conceded with practical unanimity by critics of all schools. The manifest sincerity of the letter, the Pauline characteristics displayed in a plainly unconscious and utterly inimitable way, the total lack of any plausible reason why such a letter should be forged, added to a chain of external evidence running back to Polycarp, these arguments seem to have decisively and finally answered the objections raised by some in the last century to its genuineness.

Church Addressed.—The church at Philippi was the first founded by Paul after he crossed from Asia to Europe on his second great missionary journey. He could not have worked in that city more than a few months, perhaps only weeks, before a riot was raised, and the magistrates commanded that Paul and his companion Silas should be beaten and imprisoned, in spite of the fact that they were Roman citizens. The next day, to be sure, they were released with a formal apology but they left at once to work in other places. However, in spite of the shortness of his stay, a church was founded which seems to have been more loyally and affectionately devoted to the Apostle and to have shared more largely in his own tender remembrance than any other of his churches. This is demonstratively shown by the fact that they repeatedly sent contributions to the Apostle's support, and by the character of this letter which is in large part a cordial acknowledgment of their loving generosity. Other than these personal relations there seems to have been little to discuss. The section of warning appears to have been written rather to guard against possible future evils. The only suggestion of any unfortunate condition in the church is the brief reference to a difficulty existing between two women, presumably important members of the church, and possibly ladies of rank and influence in the city. In no other Epistle does Paul find so little to correct, in no other so much to commend.

Occasion and Purpose.—As has been said, the primary purpose of this letter was to acknowledge a gift which the Philippian church had made to the Apostle in his imprisonment. It seems safe to infer that Paul was also answering a letter which the church had addressed to him in which there had apparently been some suggestion that Paul did not fully appreciate their affection and liberality, and also an expression of their fears as to the result of his imprisonment on his work as an Apostle. The Epistle assures them that their affection is fully reciprocated and their gifts appreciated, and further conveys the information that his bonds had helped rather than hindered Christian work in Rome. With these assurances go also some warnings and encouragements.

Contents.—After a salutation in which, though not in the body of the letter, Timothy is associated (i, 1, 2), Paul expresses his gratitude for their gift and his prayerfulness in their behalf (i, 3-11); assures them that the work of Christ is going on well in spite of his imprisonment (i, 12-26); urges them to unity,

humility, a blameless life, and Christian joy (i, 27-ii, 18); promises to send Timothy as his representative, even though he hopes soon to visit them himself, and bespeaks a welcome for Epaphroditus the Philippian messenger, who had been very ill (ii, 19-30). With an abrupt turn, which has led some to think that it was occasioned by news of his enemies' activity which reached him as he was writing, he warns against the "Judaizers," and offers himself as their example (iii, 1-16), adding a warning against the gross immorality of some (iii, 17-20). After various injunctions, special and general (iv, 1-9), he renews his expression of thanks for their gift (iv, 10-19), and ends with brief salutations (iv, 20-23).

Date and Place.—It is generally agreed that this letter was written during Paul's imprisonment at Rome rather than at Caesarea, as some have thought. The majority of critics also probably rightly infer from some statements in the letter that it was near the end of the imprisonment, as Paul does not appear to have the liberty which he enjoyed for two years, and seems to expect his case to be finally settled very soon. There is no certain ground on which to assign the years to the events of Paul's life and chronologies vary more than five years, but it may safely be said that this was the last of the letters from his Roman prison, and was written about 60, possibly later, possibly somewhat earlier.

DAVID FOSTER ESTES,
Professor of New Testament Interpretation,
Colgate University.

PHILIPPIC, the title applied to the remarkable speeches made by Demosthenes, the greatest of Attic orators, against Philip of Macedon. The invective of these famous orations is so powerful as to render them unique, and the term philippic has since been applied to any damnable and vituperative public address. Thus, Cicero termed philippics those orations of his which drove Mark Antony from Rome and compelled the Senate to prosecute the war against him after the murder of Julius Cæsar.

PHILIPPINE (fil'ip-in) **COMMISSION.**
See PHILIPPINE ISLANDS.

PHILIPPINE (fil'p-in, pēn, or pīn) **ISLANDS.** **Geographical Position and Area.**—The Philippine Islands lie approximately between 21° and 4° north latitude and 116° and 128° east longitude. The accompanying diagram gives their position relative to the neighboring countries. This shows that while they are not in direct line with the best developed transportation lines along the Asiatic Coast, yet they are not far distant from Hongkong, the shipping centre of the region. Previously most of the trade with Europe and America was carried on by transshipment through Hongkong, but recently several lines plying between the west coast of north

America and Manila make this city a calling port either before or after Hongkong. The islands have a direct monthly service to Europe by the Spanish mail. Also a line of steamers plying between Asiatic ports and Australia call at one or more ports of the Philippines.

The area of the Philippines, while not accurately determined, is estimated to be about 120,000 square miles. They are about the size of the State of New Mexico or almost exactly twice as large as the four States of Maine, New Hampshire, Vermont and Massachusetts.

Physical Features.—The Philippine Archipelago is made up of some 1,200 islands separated from each other by narrow channels. The largest of these with their approximate areas in square miles from the north to the south are as follows: Luzon, 43,000; Mindoro, 4,000; Samar, 5,200; Leyte, 3,800; Panay, 4,700; Negros, 4,800; Cebu, 1,600; Palawan, 4,300; Mindanao, 45,500. The islands are mountainous in nature; the larger ones have more or less continuous mountain ranges which extend in the direction of the longest axis. In some cases these ranges are nearer one side of the islands than the other; in others, large river valleys separate two parallel mountain ranges. The peaks are volcanic in origin. Only one of these reach an altitude of about 10,000 feet. There are recorded 50 volcanoes, a number of which are more or less active. Limestone deposits, often crystallized by volcanic action, occur scattered throughout the islands, especially along the coast. In some portions, large areas of stratified volcanic tufts exist.

While there are many small streams which in the rainy season are mountain torrents, there are only a few large rivers. Some of these are navigable for small draft steamers, lighters and canoes, and thus play an important rôle in the development of the valleys in which they lie. The Cagayan River in the northern part of Luzon is about 168 miles in length and drains an intermontane area of some 16,000 square miles. The Agno River drains the mountainous region in north central Luzon. The Pampanga River drains a large area of central and north central Luzon and enters tidewater at the north end of Manila Bay. The Pasig River, at the mouth of which Manila is situated, is the outlet of Laguna de Bay (a fresh water lake) and facilitates trade by small steamers between Manila and the rich region on the shores of the lake. The Mindanao River, the chief river of the island of that name, is the largest river in the archipelago. The lowest third is navigable for small draft steamers, and this bids fair to play an important part in the development of its basin, which is as yet little utilized.

Climate.—The insular nature of the Philippines exerts an important influence on the temperature and ameliorates what might otherwise be an extremely unhealthy climate. The climate of Manila is divided into seasons, viz., the rainy season (June to November); the cool dry season (December to February); and the hot dry season (March to May). For nine months of the year the nights are comparatively cool, for the remaining three months there are only a few excessively hot nights. At Manila the annual mean is 80°, the January mean, 77°, and the June mean 82°. The highest recorded temperature is a little over 100°, and the lowest a little under 60°. The

above figures give a fair idea of the temperature condition through the islands at or near sea-level, though interior points and points farther north show greater oscillations in temperature, and those nearer the equator less oscillations.

At high altitudes the climate is much lower. Thus at Baguio (altitude of station 4,777), formerly the official summer capital, now a summer resort, the mean annual temperature is near 65°, the mean maximum, 77°, and the mean

minimum, 53°. The mean annual rainfall varies from less than 40 inches to over 120. Without going into the causes that produce the variations in rainfall in different parts of the islands, it is sufficient to state that they have been divided into different zones as follows: (1) Zone of very definite rainy and dry seasons: mainly the western coast of northern and central Luzon, western coasts of Mindoro and Panay and the Calamianes group. (2) Zones of long rainy season and short dry season. The northern and western coasts of Luzon, the central Visayans and northern Mindanao. (3) Zones with more or less uniform distribution of rainfall over the whole year: the southeastern end of Luzon; the eastern Visayans, eastern and southern Negros and Panay, the eastern and southern coast of Mindanao and the Jolo group.

In the summer and autumn months the rainfall is abundant throughout the archipelago. The winter or northeast rainfall is, generally speaking, abundant in zones 1 and 2. The spring rainfall in the months of March, April and May, due to local disturbances, occurs in all zones but is most abundant in zone 3. The different classes of rainfall are important because they determine to a great extent the classes of crops that can be raised most successfully in the different parts of the islands.

The typhoons, or baguios as they are locally

called, are cyclonic winds that cause annually great destruction to growing crops, shipping, and buildings of all kinds. Sometimes when most severe they are accompanied by heavy rains, and these flood the streams and lowlands, thus adding to the loss of property and lives. The study of the history of these storms has been carried on for years by the Weather Bureau in the Philippines, which, aided by a large number of stations throughout the islands, can predict with great certainty the approach of a typhoon. The warnings of this bureau have for years saved large sums of money to the shipping industry, not only by the Philippines, but of the neighboring Asiatic coast as far north as Japan. The reader is referred to the publications of the bureau for an extended description of these storms. It is sufficient to state here that southern Mindanao and the Jolo group are practically free from them, that they generally originate to the east and southeast of the archipelago, have a general northwest trend and occur most frequently in the months of July, August and September.

Population and Inhabitants.—The census of 1903 gave the population as 6,975,073. An estimate on the basis of the electoral vote as furnished by the Bureau of Insular Affairs in 1915 placed the total population at 9,503,271. In 1918 it was 10,314,310. See following table:

The foregoing table shows that of the population of the islands, 8,486,713 are classified as Christians, 315,980 as Mohammedans and 700,578 as pagans. The city of Manila has a population of 285,306.

It is generally conceded that the original inhabitants of the islands were Negritos (*Ætas*) who belong to the eastern section of the Ethiopic division of the human race. To-day there are not more than 30,000 of these people scattered through the mountains of some of the larger provinces. The most civilized of them are more or less mixed with the Malays. They are pure or nearly savages, a nomadic people living on roots and products of the chase, though many of them, where in contact with the Christians, piece out their existence by trade in forest products, principally rattan, gums and resins.

After the Negro invasion came the Malays, who gradually spread throughout the islands. The most progressive of the primitive races are the Igorrotes and allied tribes of the mountains of northern Luzon. Other mountain tribes of importance are the Tagbanuas of Palawan, the Manguianes of Mindoro and several of Mindanao. Besides the wild tribes or Pagans, as they are officially designated, are the Christians (Filipinos) and the Moros (Mohammedans). In point of numbers the three most important groups of Christian Filipinos are the Visayans of the Central Islands, the Tagalogs of central Luzon and the Ilocanas of the north-

west coast of Luzon. Besides numerically important are the Ybanags of the Cagayan Valley, the Pampangans and Pangasinanes of the flat country north of Manila and the Bicol of southeastern Luzon. The languages of these several tribes are as a rule very different, but where they come in contact with each other they sometimes merge. This is especially the case with the Bicol, which has elements of both the Visayan and Tagalog languages. The Filipinos also occupy various points on the coast of Mindanao. Sometime previous to the discovery of the Philippines, Malay missionaries imbued with the Mohammedan faith carried their religion to the southern islands. This religion, tinctured with paganism, overran the Sulu Islands and parts of Mindanao and resisted successfully the attempts of the Spaniards to change it to the Christian religion.

Previous to the time of discovery of the Philippines there was more or less trade with the Chinese, but few, if any, had settled in the islands. Only after the Spanish conquest did any considerable number migrate to the islands. At present there are perhaps 100,000 Chinese in the islands, and a very much larger number of Chinese mestizos. Previous to the discovery Japanese colonies were made in certain parts of Luzon and left their imprint in racial features on the Tagalogs. Of late years considerable numbers of Japanese have immigrated to the islands. The most important colony is in the

Davao district of Mindanao, where they are engaged in the cultivation of hemp. The Spanish left their racial imprint on the population and Spanish mestizos form a considerable proportion of the population. The American influence in racial features has so far been almost negligible.

SPANISH RULE IN THE PHILIPPINES.

Magellan discovered the Philippine Islands in 1521. From this date until 1565 unsuccessful attempts were made by the Spaniards to establish themselves in the islands. In 1565 Legaspi landed at Cebu and the conquest of the islands began. Notable events during this period were as follows: (1) In 1570 the native city of Manila (Maynila) was captured by Legaspi, but it was not until the following year that the modern Spanish city was founded. (2) In 1574 Limahong, a Chinese pirate, attempted to capture Manila and later to establish himself in Pangasinan, but both attempts failed. (3) In 1581 the first bishop of Manila arrived and almost immediately there began conflicts between the civil and religious authorities. (4) In 1596 the first attempt to colonize the southern Philippines was made and a settlement established near Zamboanga, Mindanao. (5) In 1599 this settlement was destroyed and then commenced (1600) a series of Moro raids which menaced the northern islands until about 1800. During the period from 1565 to 1600 the conquest of all the large islands except Palawan and the Moro country was practically completed and the people for the most part were ready to be converted to Christianity. Manila had become the first city of the East. Trade was established with China, Japan, India and Malacca. The period from 1660-63 was marked by a series of conflicts with the Dutch and Moros. In the meantime, 1580, under Philip II, Portugal had been conquered by Spain and with this seizure all the rich Portuguese colonies of the East Indies came under the rule of the Spaniards with the centre at Manila. With the loss of the Spanish armada in the English Channel, the rule of the East passed to the English and Dutch.

The conflict between the Dutch and Spanish for possession of the East ended in the loss to Spain of most of the possessions to the south in the hands of the Dutch, although efforts of the latter to gain possession of the Philippines were without success. In 1640 Portugal freed herself from Spain and Spain lost the remainder of her possessions to the south. During this period the raids of the Moros continued. These pirates did much damage. This led to efforts on the part of Spain to conquer these warlike people, which resulted in the conquest of Jolo and the establishment of a stronghold at Zamboanga. In 1662 Koxinga, a Chinese pirate, demanded the surrender of Manila. This danger was so great that the Spaniards concentrated all their efforts to resist the threatened invasions and abandoned some of their strongholds in the south. The Chinese in Manila were suspected of being in the plot. They assaulted Manila but many were slain and the remainder left the city. The threatened invasion never was carried out for Koxinga died. The effects of the events cited above left Spanish prestige at

a low ebb. Manila was no longer the principal commercial centre of the East and never again recovered that position. The century that followed from 1663-1762 has been described as one of obscurity for the Philippines. It was filled with conflicts between the civil and Church authorities. Corruption and violence went unrebuked. Efforts made by Spain to correct the abuses were for the most part without success. One of the courageous governors was killed by Church authorities. Commerce between South America and the Philippines was forbidden and that with Mexico greatly restricted for the benefit of the merchants of Spain. This economic policy nearly paralyzed trade. Moro piracy again became active. In 1762 the English captured Manila, but made no attempt to extend their conquest. By the Treaty of Paris in 1763, the Philippines were restored to Spain. From then to 1897 Spain was in undisputed control of the Philippines. The loss of her South American colonies between 1810-25 did not greatly influence her in the treatment of her remaining colonies—Cuba, Porto Rico and the Philippines. During this period undoubted progress was made in the industrial development of the Philippines. Some of the more progressive governors encouraged agriculture, favorable commercial legislation was passed and the opening of the port of Manila in 1837 was followed by increasing prosperity. The different religious organizations of the Church, which at first were devoted principally to religious and educational work, increased in power and wealth and often overshadowed the local rulers in different parts of the islands. The Spanish friars thus became powerful. Their paternal authority was often used to suppress radical views. The vast estates which they owned materialized their religious zeal. Contact with the outside world, through the opening of foreign commerce, brought to the Philippines, Spaniards who had been influenced by the revolutionary changes in Europe and agitation against the power of the friars began. The first newspaper made its appearance in 1822; a number of others followed in the forties. The first publications were Spanish and were followed later by periodicals printed in the local tongues. Though severely censored, these papers spread liberal ideas. In 1863 public schools were authorized. The friars were the local inspectors of the schools. However, the boys and girls who attended the schools grew ambitious for further progress. Parties for reform were started. One leader of these reform parties was José Rizal. He was educated by one of the Jesuit colleges, studied in Spain and traveled in other European countries. While there he wrote his first novel entitled 'Noli Me Tangere,' which dealt with his life in his Filipino home, and in this and a later novel he set forth his ideas of reform. This work made him enemies and on his return to the islands he was arrested and deported to Mindanao in 1892. While incipient revolts against the government and especially the friars previous to this time had been easily repressed, a more serious one in 1896 led to the arrest of many prominent and rich Filipinos and to an organized revolt under the leadership of Aguinaldo. This revolt was suppressed but not without great difficulty. Rizal returned to Manila in 1896 and though it was disapproved

that he had any part in the revolt he was sentenced to death and shot on 30 Dec. 1896. This execution only added flame to the feeling. It broke out afresh in 1897 and ended only on promises of reform. Aguinaldo and some of his followers agreed to leave the islands on the payment of 600,000 pesos. This they did on 27 Dec. 1897.

The Spanish-American War.—Because of misrule in Cuba, the people of the United States had long been in sympathy with the Cubans in their struggle for independence. On 20 April 1898, shortly after the battleship *Maine* had been destroyed in the harbor of Havana, the American Congress demanded that Spain should recognize the independence of Cuba. Spain refused and this was followed by war. On 1 May 1898 Admiral Dewey destroyed the Spanish fleet at Cavite. On 13 August Manila surrendered to American land forces. On 10 December the treaty of peace was signed at Paris. By the terms of this treaty Spain ceded to the United States for \$20,000,000, the Philippine Islands. Before the capture of Manila, the insurrection of the Filipinos broke out afresh. Aguinaldo returned to the islands and became the leader. A provisional government was organized by the Filipinos and the independence of the archipelago was proclaimed. The expectation was that as soon as the Spaniards were defeated the Americans would withdraw. Disappointed in the terms of the treaty, Manila was attacked by the Filipinos on 4 Feb. 1899 and war was declared against the United States. This continued until March 1901 when the insurrection was broken by the capture of Aguinaldo, though it was some time after this before all the leaders surrendered.

THE PHILIPPINES UNDER AMERICAN RULE.

The policy of the United States has been from the beginning one of increasing autonomy for the Filipinos. The question of how rapidly this should be granted and how far it should go has been in constant dispute among experts on colonial history. The political parties of the United States represented two opposing views; the Republicans advocating caution and slowness in developing self-rule and the Democrats urging independence either at once or the fixing of the date in the near future. The time from the suppression of the insurrection to the present date can be divided into three periods, each of which marks an advance toward increasing autonomy.

1. The Rule of the Islands by a Commission.—In June 1900, President McKinley appointed a commission of five members, headed by William H. Taft, to legislate for the islands and to prepare a way for establishment of civil government. A little later three Filipino members were added to the commission. On 4 July 1901 civil government was established with changes from time to time in the personnel and lasted by commission until 15 Oct. 1907. The government was very liberal. It provided for practically self-government of the municipalities and part self-government for the 38 provinces of the islands. The central government for the purpose of administration was divided into four departments, viz.: interior, finance and justice, commerce and police and public instruction. Under these departments the various bureaus were organized.

Education.—The keystone to the arch of American rule has been education, not only by the establishment of a public school system and its extension as rapidly as the funds would permit, but education consciously or unconsciously among the Filipino employees in the various bureaus. As only a few of the educated Filipinos had a knowledge of Spanish, in the absence of a common native language the English language was decided upon as the basis of education. Some idea of the progress made in extending education is given by the following figures: Up to 1914 there had been established 3,913 primary schools, 278 intermediate schools and 44 secondary schools; in 1921 the number of schools had been increased to 7,659 with 1,070,255 pupils. In 1914 there were 9,462 Filipino and 612 American teachers; in 1921 the Filipino teachers had increased to 13,829 and the American had decreased to 352. In 1921, out of an estimated total of 1,400,000 children of school age, 1,070,255 were receiving free elementary education. For the five years from 1912 to 1916 the school expenditures from all sources amounted to nearly \$20,000,000, of which about \$13,000,000 was furnished by the central government. This amounts to about 17 per cent of the total revenue of that government during the same period. Industrial, agricultural and physical training take a very prominent place in the educational system of the islands, much more so than in the public school system of the United States. No act of American rule in the Philippines has done more to convince the Filipino people of the unselfish purpose of the United States in remaining in the islands than the attitude toward education.

Reconstruction.—The early years of the rule of the commission were devoted mainly to various reconstruction problems. In many provinces a number of subordinate leaders of the insurrection refused to follow the leaders in submission. They kept up a period of raid and pillage that continued until late in 1906. The evil was overcome but not without some serious mistakes on the part of the government in handling it.

Shortly after the establishment an epidemic of cholera visited the islands and before it had run its course some 200,000 deaths were recorded. Smallpox, until checked by a resumption of general vaccination, claimed a large number of victims. Bubonic plague in the early days was a source of much worry to the officials. Diseases assailed animals as well. Surra and rinderpest nearly depopulated the islands of work animals. At first, with little trained help to combat these diseases and against strong opposition by many interests, by the establishment of rigid quarantine, these epidemics were brought more or less under control, so that to-day, with the exception of rinderpest, the islands are comparatively free of these diseases.

The purchase by the government of the lands held by the friars, the misuse of which was one of the main causes of discontent in Spanish days, did much to settle the intense feeling that the Filipinos had against the clerical ownership of these properties. Among other measures undertaken by the commission was the perfecting the civil service by strengthening the merit system upon which it was based;

guaranteeing interest at 4 per cent for a period of 30 years on the bonds of railway companies to attract capital to construct them; the improvement and beautifying the city of Manila; sanitary measures of all kinds throughout the islands; a reform in the currency, which gave a stable medium of exchange; the adoption of the metric system as the best means of standardizing the unstable system of weights and measurements, and establishing a postal savings bank connected with the Bureau of Posts, to encourage savings among the Filipinos.

In the meantime the American Congress recognizing the political ambitions of the Filipinos as legitimate and promising passed an act creating a Philippine assembly. This act provided that the appointed commission should remain as the executive head of the government and should share with an elected assembly the legislative powers. The act provided that the Philippines should be represented in the House of Representatives at Washington by two resident commissioners, but without votes. It further provided that bills introduced by either body of the legislative powers should have the consent of both bodies before it became a law, but that in case the two houses could not agree upon appropriation, the budget of the preceding fiscal period should remain in force. It also provided that the non-Christian people (the pagans and Mohammedans), being not ready for self-government, should not be subject to the government by the Christian people, hence the former were left to the exclusive jurisdiction of the commission. This leads to the second period of government under American sovereignty.

2. The Rule of the Islands by an Appointive Commission Composed of a Majority of Americans and an Elective Philippine Assembly.—The first assembly of the Philippine Islands was inaugurated on 16 Oct. 1907. The result of this dual legislative arrangement, one controlled by the Americans and the other by Filipinos, while it led to some friction between the two houses, especially in regard to appropriation bills, to the rejection of some measures advocated by one or the other bodies, was on the whole fairly successful. Changes in the personnel of the commission had continued from time to time.

Mr. Taft left Manila in December 1903 and Luke E. Wright was inaugurated as governor-general February 1904. He was succeeded by Henry Clay Ide on 12 April 1906. The next man to hold the office was James F. Smith, from 20 Sept. 1906 to May 1909, when he was followed by Cameron F. Forbes, who remained in power until October 1913.

The Presidential election of 1912 placed the Democrats in power by the election of President Wilson. As the Democrats were committed to an early independence, this changed radically the policy of the rule. President Wilson appointed Burton Harrison as governor-general. This inaugurates the third period of American rule in the Philippines.

3. Rule by an Appointive Commission Composed of a Majority of Filipinos and an Elective Assembly.—Governor-General Harrison in his inaugural address stated that it was the policy of President Wilson to appoint to the commission a majority of Filipinos. This gave the people of the islands control of both

branches of the legislature. In his message to the assembly which convened in October 1913 he announced that no more American employees would at present be engaged. There began at once an exodus of many American employees and substitution of Filipinos for a number of important and many subordinate positions in the different bureaus. In the meantime the Democratic Congress pressed their measure to provide for an early independence of the islands by the passage of the so-called Jones bill. This bill at first fixed the date for the establishment of a republic at 1921. This act as finally approved, August 1916, did not include the date. The preamble reads as follows:

"Whereas, It was never the intention of the people of the United States in the incipency of the war with Spain to make it a war of conquest or for territorial aggrandizement; and

"Whereas, It is, as it has always been, the purpose of the people of the United States to withdraw their sovereignty over the Philippine Islands and to recognize their independence as soon as a stable government can be established therein; and

"Whereas, For the speedy accomplishment of such purpose it is desirable to place in the hands of the people of the Philippines as large a control of their domestic affairs as can be given them without in the meantime impairing the exercise of the rights of sovereignty by the people of the United States, in order that, by the use and exercise of popular franchise and governmental powers, they may be the better prepared to fully assume the responsibilities and enjoy all the privileges of complete independence."

It provided for an elective legislative assembly composed of a senate and house of representatives and a governor-general appointed by the President of the United States. By the act certain classes of laws passed by the legislature are subject to the approval of the President. The President also has the power to appoint a vice-governor, an auditor and the chief and associate justices of the Supreme Court. A bureau of non-Christian tribes is created which is more or less under the control of the governor-general. Another restriction limits the power of the newly-constituted assembly to limit the indebtedness to \$15,000,000 at any one time, exclusive of the friar land bonds. With the exception of these and other restrictions, mainly to ensure constitutional rights to the people and the sovereignty of the United States, the assembly has large powers. With the creation of the machinery to carry out the provisions of this act, the people of the Philippine Islands under American sovereignty passed the fourth and probably last milestone on their march toward independence, for in April 1918, President Wilson publicly announced to a delegation of Filipinos appearing in Washington to ask for independence that the time was ripe for granting their desire.

Whatever may be the outcome, the American people can look with pride on the quarter century of their rule in the Philippines. Sweeping aside all precedents there was inaugurated a new precedent in colonial rule. They found the islands in a deplorable backward and unsanitary condition; they have made them prosperous and fairly clean. They found a people with many languages and for the most part uneducated. They have succeeded in giving an opportunity of obtaining an education in a common language to more than half the people of school age throughout the islands.

In this place it is opportune to recount the progress made along various lines and to sum

up the richness of the islands in natural resources.

The Vegetation.—The flora of the Philippines, like all tropical regions, is rich and varied. In the early days of American occupation provision was made for its classification, until to-day our knowledge concerning the flora of the islands has developed more rapidly proportionally to the time occupied in it than any other tropical region of the same area. Much remains to be accomplished. The great wealth of the natural vegetation consists in the forests. Soon after the occupation of the Americans a bureau of forestry was established, grafted onto the old Spanish organization. Whatever can be said against Spanish rule, it had kept the forest lands of the islands under government control, so that when the Americans took possession they found that practically 99 per cent of forested area was owned by the government outright. No other country in the world has such a large proportion of its forest land under government ownership. Steps were immediately taken to conserve and properly use this asset. To this end a comprehensive forest act was passed, which, with some changes, remains in effect to-day. It soon became apparent that forest asset was not sufficiently utilized. The islands were importing considerable quantities of timber that was believed could be obtained at home. In order to attract capital for the instalment of more modern methods of logging and milling an inventory of the forest resources was undertaken.

This inventory showed that vegetative classification of the islands to be as follows:

	Square miles
Virgin forests.....	40,000
Second growth forests.....	20,000
Grassland with scattered tree growth.....	48,000
Cultivated lands.....	12,000
Total.....	120,000

The amount of standing timber in the islands is estimated at about 200 billion board feet, or more than half the amount of standing timber in the famous yellow pine forest of the southern part of the United States. Moreover, the forests are comparatively simple in composition, and in heavy enough stands, to warrant the introduction of logging machinery. A large proportion of the stand consists of classes of timber that can be used as substitute for pines and oaks in all classes of general construction work. While it is true that the Philippines are as rich in fancy hardwoods as other tropical forests, yet the great richness of the forests consists in their heavy stands of comparatively light hardwoods that are easily worked and thus meet the demands of the general rather than the special markets.

The publications of the Bureau of Forestry that called attention to these facts soon succeeded in attracting capital, and in this way the lumbering industry of the islands has been rapidly developed, so that when the World War curtailed transportation the islands were found not only to be self-supporting in their requirements for the raw product of lumber, but for the first time in their history had a considerable surplus for the export trade. In 1910 the lumber production of the islands amounted to 176,758 cubic meters; in 1917 it

had reached 366,891 cubic meters. In 1922, 43,000 cubic meters were exported.

The following trade figures showing the value of timber and lumber exported and imported gives some idea of the growth of the local industry in six years:

	Exports	Imports
1910.....	\$30,000	\$300,000
1916.....	565,000	170,000

All the timber is cut under the control of the Bureau of Forestry. The revenues obtained amount to about twice the cost of maintaining the bureau. Besides timber there are other forest products, such as dyewoods (sappan or Brazil wood mostly), tanbarks, rattan, bamboo, resins, gutta percha, but very little wild rubber.

Mineral Resources.—Comparatively speaking, the archipelago cannot be said to be very rich in mineral resources. While gold, silver, iron, copper and manganese ore are known to exist, only the gold mines are producing. Of recent years the developing of these has been greatly stimulated. In 1911 the production of gold amounted in value to about \$150,000. This has steadily increased until in 1917 the production reached a little more than \$1,500,000 in value. Coal, slightly inferior to that of the imported Australian and Japanese for steaming purposes, exists, but up to the present time the deposits have been little worked. Signs of petroleum are found in certain sections, but up to 1918 the evidence is not conclusive that the Philippines contain paying quantities of this valuable article.

Fauna, Wild and Domestic.—The islands are not rich in large mammals: wild hogs, deer, monkeys and a small buffalo called the timarau are the principal ones. Small mammals are more abundant. A manual of birds published in 1909 showed 739 known species recorded. There are probably many more. Of the many varieties of snakes, the python is the largest. Crocodiles are fairly abundant in some of the fresh waters and are sometimes seen along the coast, in the sea. There are many varieties of fish which constitutes an important item of food, and in the southern waters fishing for pearls is a profitable industry. The most important domestic animal is the water buffalo, called carabao. This has escaped domestication and in some islands, like Mindoro, there are wild herds of this animal. Rinderpest is the greatest enemy of the water buffalo, and while great attempts have been made to rid the islands of this disease, it is still present and is one of the principal reasons why the islands have never been able to raise enough rice to be self-supporting in this valuable cereal. The cattle industry which formerly was a profitable one is now at a low ebb because of the ravages of this disease. Other domestic animals have been imported.

Commerce and Agricultural Products.—Since the main exports of the islands consist of agricultural products, commerce and agricultural products are discussed together. In 1899 the total trade of the islands amounted to about \$32,000,000. From that date there has been a steady increase in the foreign commerce. The following table will show this trade and its relation to the United States:

TOTAL FOREIGN TRADE.

TWELVE MONTHS ENDING 31 DEC.	Consignments from United States	Consignments from other countries	Total	Shipments to United States	Shipments to other countries	Total
1910.....	\$20,068,542	\$29,650,819	\$49,719,361	\$17,241,725	\$23,386,738	\$40,628,463
1911.....	19,156,987	28,867,420	48,024,407	19,827,030	24,760,261	44,587,291
1912.....	24,309,010	37,358,941	61,667,951	22,814,238	31,970,500	54,784,738
1913.....	26,676,261	26,636,525	53,312,786	16,434,018	31,338,938	47,772,956
1914.....	24,020,395	24,568,258	48,588,653	24,427,710	24,261,924	48,689,634
1915.....	26,381,069	22,931,115	49,312,184	23,653,211	30,159,793	53,813,004
1916.....	22,862,673	22,633,665	45,496,338	35,648,133	34,289,050	69,937,183
1917.....	37,620,648	28,176,383	65,797,031	63,234,359	32,369,948	95,604,307
1921.....	74,130,015	41,708,559	115,838,574	50,356,793	37,758,530	88,115,323
1922.....	43,298,142	36,899,358	80,197,500	60,700,000	34,883,500	95,583,500

From 1899 to 1916 the balance on trade was mostly against the islands, but the year 1916 left a net balance in favor amounting to more than \$5,630,000. This balance in 1921 was \$22,924,468.

Export Trade.—As shown by the above table the total value of exports increased from more than \$49,000,000 in 1910 to \$95,583,500 in 1922. Manila hemp has from the beginning been a principal article of export, amounting to \$39,082,000 in 1922. The banner year of hemp production in amount was in 1912, but the increased value of hemp put its value at more than double that of 1912. Manila hemp has long been considered the most valuable cordage fibre in the world. It is produced by a species of *Musa*, the same genus to which the banana belongs and looks very much like this plant. While efforts have been made to cultivate it in commercial quantities in other tropical countries than the Philippines, these attempts so far have been unsuccessful. The products of the cocoanut palm stand next to hemp in value of the exports. Previously the dried "flesh" of the nut under the name of "copra" was shipped mostly to Europe. Of late years, however, mills for extracting the oil have been erected and now the value of the shipments of cocoanut oil exceeds that of copra. The following table gives some idea of the growth of this industry and the share of the United States in this industry:

COCOANUT PRODUCTS.

	Copra shipments	Cocoanut oil shipments	Shipments to United States
1910.....	\$10,639,049	\$16	\$638,783
1922.....	14,103,000	16,734,500	26,518,000

Thus, whereas the United States imported a very small proportion of the cocoanut products in 1910, in 1922 it absorbed nearly all of approximately \$31,000,000 worth of these products. While the price of cocoanut products has remained nearly stable, the amount produced has nearly doubled. The scarcity of animal fats during the late war no doubt stimulated the use of cocoanut oil. Its principal use is in making the so-called coco butter. This valuable substitute for butter has been so favorably received that there will be a steady demand for it in the years to come. In 1922 sugar was first in importance of the exports. The shipments of this product amounted to \$7,224,385 in 1910, of which nearly all was made to the United States. This had increased to \$25,582,500 in 1922; less than half was exported to the United States. Owing principally to the lack of tonnage the exports in 1917 decreased to \$12,277,679. Tobacco is the last of the four principal export-

ing articles of the Philippines. The products shipped are in the form of leaf tobacco and cigars. In 1910 the exports amounted in value to \$4,315,531, of which about one and a half million dollars worth went to the United States. In 1922 the total shipments amounted to \$8,074,000, of which nearly six and a half million dollars worth were destined for the United States.

The value of the other principal products exported in 1922, besides lumber and gold, which have already been mentioned, are as follows:

Embroideries and hats.....	\$3,733,000
Maguay.....	1,486,500
Pearl buttons and shells.....	208,500

Imports.—As shown by an above table the total value of the imports of the Philippines increased from \$49,719,361 in 1910 to \$80,197,500 in 1922. Of the above amount cotton goods imported stand first, having a value in 1922 of \$17,203,000. Of this amount the United States furnished 70 per cent of the total. Iron and steel stand next in value with a total of \$7,604,500 in 1922; approximately 85 per cent of the total importations of this commodity were furnished by the United States. Rice, the staple food product of the islands, stands eighth in the value of imports. In 1922, \$2,302,000 worth of rice was imported. Efforts made to render the islands independent of importation of rice, while not entirely successful, have resulted in a steady increase in the production of this valuable product. Among the other principal products shipped into the islands in 1922 were: wheat flour (\$2,892,000); crude oils (\$2,669,000); coal (\$2,504,000); paper and paper goods (\$2,460,000); meat products (\$2,312,500); dairy products (\$1,962,500); gasoline (\$1,902,000); illuminating oils (\$1,738,000); silk and silk manufactures (\$1,558,500); chemicals, dyes, drugs, etc. (\$1,473,000); fish and fish products (\$1,417,500); tobacco manufactures (\$1,240,000); electrical equipment (\$946,000); cattle and carabao (\$830,500); leather and leather manufactures (\$783,000); automobiles and parts (\$703,500); lubricating oils (\$327,500).

Agricultural Crops.—The following table gives the area planted to the principal crops in 1921 (hectare=2.47 acres).

CROP	Hectares	CROP	Hectares
Abaca (hemp)....	548,094	Corn.....	543,828
Cocoanuts.....	417,959	Sweet potatoes...	65,561
Sugar cane.....	241,345	Bananas.....	83,206
Tobacco.....	90,980	Mangoes.....	10,534
Rice.....	1,673,381	Rubber.....	4,600

Of these products rice, corn, cacao and coffee are practically all consumed at home.

PHILIPPINE ISLANDS

1 A Country Road in the Philippines

2 Mouth of the Pasig River, Manila

PHILIPPINE ISLANDS

1 Well-cultivated fields, Basco (Batan Island)

2 A country scene in the Philippines

The others, as shown above, are mainly exported.

Transportation and Public Works.—No doubt much of the recent economic prosperity of the Philippines has been due to increased transportation facilities. In 1900 there were about 100 miles of railroad in the islands. To-day nearly 1,000 miles have been completed. The bonded indebtedness of the railroads amounts to \$22,263,000 and the interest on this amount up to 4 per cent is guaranteed by the Philippine government. At the time of American occupation the highways built by the Spaniards had become impassable. To date there have been built 2,318 miles of first class, 1,275 miles of second class and 2,105 miles of third-class roads. Re-enforced concrete structures consisting of schoolhouses, provincial buildings, markets, etc., to the number of over 4,000 have had been built to date. There are in existence 7,370 durable bridges and culverts and 728 artesian wells have been driven. By furnishing pure potable water these latter have been very instrumental in reducing greatly the mortality of the regions in which they exist.

Revenues and Expenditures.—With the exception of the cost of maintaining an army in the Philippines by the United States, the islands have been self-supporting under American rule. During the year 1921 the total revenues of the Philippine government amounted to \$84,289,932, and the expenditures to \$83,549,778. The surplus on hand on 1 Jan. 1922 was over \$6,000,000. The bonded debt service of the Philippine government, in 1921, was \$3,459,281. The indebtedness of the cities of Manila and Cebu are included with that of the central administration.

H. N. WHITFORD,

Yale School of Forestry, New Haven, Conn.

PHILIPPINE LANGUAGES AND DIALECTS. Established languages, having an extensive printed literature, are the following: 1. Tagalog, with 1,500 printed books and pamphlets, 80 periodicals and 1,789,049 people making use of this tongue. 2. Bisaya or Visaya, (a) Panayan dialect, with 500 printed books and pamphlets, 21 periodicals and 1,289,142 people; and (b) Cebúan dialect, with 120 printed books and pamphlets, 17 periodicals and 1,848,613 people. 3. Ilóko, with 500 printed books and pamphlets, 40 periodicals and 988,841 people. 4. Bikol, with 300 printed books and pamphlets, 6 periodicals and 685,309 people. 5. Pampañgan, with 270 printed books and periodicals, 7 periodicals and 337,184 people. 6. Pañgasinan, with 100 printed books and pamphlets, 4 periodicals and 381,493 people.

Thus we find the total number of printed books and pamphlets in these six leading tongues to be 3,290; the total number of periodicals, 175; the total number of people speaking one or more of these six established languages to be 7,319,631.

Semi-established languages having less printed literature than the foregoing are: 1. Bisaya (a) Samar-Leyte dialect, with 40 printed books and pamphlets, 6 periodicals and 601,683 people; and (b) Aklán dialect, with 15 printed books and pamphlets, 1 periodical and 137,772 people. 2. Ibanag, with 50 printed books and pamphlets, 3 periodicals and 136,134 people. The totals for this class are: Printed books and pamphlets, 105; periodicals, 10; number of people, 875,589.

Dialects having still less printed literature (1 to 10 books or pamphlets) are the following: Sulu, population 87,400; Bontok, population 29,258; Bagobo, population 5,000; Isinai, population 2,647; Ivatán, population 6,392; Gaddang, population 16,240; Magindanao, population 79,850; Tirurai, population 7,150; Ifugao (pure), population 86,000; Ilongot, subdivision Egónigut, population 2,150; Kalamian, population 11,350; Tagbanúa, population 10,000; Tinggian, population 27,648; Igorot (a) Baúkok, population 12,000 and (b) Inibaloi, population 12,621; Lanao, population 58,350; Mangyan, subdivision Hampangan, population 5,250; Sambal, subdivision Iba Sambali, population 39,715; Subánun, subdivision Sindangan, population 10,000. The total population in this class, therefore, 509,621.

Dialects having no printed literature but of which brief vocabularies have been published are Atá (Dugbatang dialect), population 1,000; Bilá-an, 8,000; Gaddang (Yógad dialect), 5,000; Ifugao (subdivision Ifugao dialect), 45,000; Igorot (Kankanai dialect), 27,887; Ilongot (Ibilao or Abaká dialect), 2,000; Isamal, 983; Kalinga (Giná-an dialect), 6,000; Mandaya (Mansáka dialect), 5,000; Mangyan (a) Abra de Ilog dialect and (b) Bako dialect, each 2,000; Manóbo, 30,600; Sambal, subdivision Bolinao Sambali, 16,431; Subanun (a) Dapitan dialect, 8,450; (b) Buluan-Kipit dialect, 6,000; (c) Tukuran dialect, 7,000; Tagakaólo, 7,100. Total population in this class, 180,451.

Dialects known only through manuscript vocabularies or verbal information are Apáyao, used by 23,000 people; Atá, Tugauánun dialect, 500; Bagóbo (a) Giángá dialect, 1,200; (b) Obo dialect, 350 and (c) Eto dialect, 200; Bilá-an, Tagabili dialect, 2,400; Bisaya or Visaya, Mindanao dialects, 100,000; Bontok (a) Kadaklán-Barlig dialect, 8,000; (b) Tinglayan dialect, 20,000; (c) Dananao-Bañgáad dialect, 6,000; Bukidnon (a) Bukidnon dialect, 38,500 and (b) Banuauon dialect, 10,000; Dumágat, 352; Gaddang (a) Maddukayang dialect, 8,480; (b) Kataláñgan dialect, 2,000; (c) Iraya dialect, 2,000; Ibanag, Itávi dialect, 20,000; Ifugao, Lagáui dialect, 1,500; Igorot (a) Malaya dialect, 8,000 and (b) I-wáak dialect, 800; Ilongot (a) Italon dialect, 2,000; Kalinga (a) Dadayang dialect, 12,000; (b) Kalágua dialect, 12,000; (c) Nabayugan dialect, 2,000; (d) Mañgáli-Lubo dialect, 13,000; (e) Lubuágan dialect, 16,450; (f) Sumadel dialect, 6,000; Kuláman, 3,600; Mandaya (a) Mandaya dialect, 15,000; (b) Pagsúpan dialect, 5,000; Mangguáñgan dialect, 2,500; Mangyan (a) Bañgon dialect,

2,000; (b) Bukil dialect, 1,000; Manóbo (a) Debabáon dialect, 3,000; (b) Libagánon dialect, 6,000; Palawan dialect, 1,940; Samal dialect, 78,720; Sanggil dialect, 2,450; Tagbanúa, Palúan dialect, 9,460; Yakán dialect, 7,290. Total number of persons using dialects of this class, 454,672.

Negrito and Negroid groups number about 35,926; non-Negroid or semi-Negroid Hill Peoples, 46,015. It must be said in regard to many of these Negrito groups and hill tribes that their dialects remain practically unknown; and, if we add 8,000 for certain Atá and Bogobo groups, we reach a total of 89,941 for this class.

Foreign-born residents, a relatively small element, numbering 73,366 (according to statistics published at Manila in 1917), employ by preference Spanish, English and other languages of Europe and the mainland of Asia—languages which lie beyond the scope of the present article.

The foregoing list of native languages and dialects, fairly complete for the Christian peoples and for the majority of the sedentary and semi-sedentary non-Christian groups, is nevertheless unavoidably incomplete in its relation to the more primitive pagan peoples, and especially those living in migratory bands. The idioms of those peoples credited in the foregoing list with a considerable written literature are referred to as "languages," while those of tribes having little or no written literature, and whose speech is therefore changeable and far from permanent, are regarded as "dialects." Naturally, however, the term dialect is also used to indicate local variations from established forms of written languages. Professor Beyer, of the University of the Philippines, writes that "of dialects, in the latter sense, we have a multitude in the Philippines which are not recorded. For example, the spoken Tagalog of Batangas province differs considerably from that of Bulakán, while in Laguna, Cavite, Marinduque and other places there are still other Tagalog dialects. It is nevertheless quite permissible to speak of the Tagalog language, for the reason that the native newspapers and the more than 1,500 books and pamphlets printed in Tagalog have fixed the general character of the written speech." Many of the Bisayan or Visayan dialects having developed extensive literatures of their own, are quite properly treated as separate languages.

Dr. Frank R. Blake and Mr. F. C. Cole have written conservatively: "The influence of Chinese trade, which has been carried on for several centuries, is found in the vocabularies of nearly all the tribes and the effect of the American and of the earlier Spanish occupation of the islands has been by no means inconsiderable." These are comparatively unimportant influences. Let us consider now the chief formative influences that trace their origin to early waves of colonization through conquest. Dr. Blake thinks that the Philippine languages, so far as they are known, form a closely related group of tongues belonging to the Malayo-Polynesian family (compare writings of Churchill, W.); and it seems most likely that the cradle of the Malayo-Polynesians, whose ancient history is practically a sealed book, was on some of the numerous islands which it now inhabits, possibly some of the large islands in the vicinity

of the Malay Peninsula (or upon the Malay Peninsula itself, more probably). These ancient progenitors of a race so typically seafaring in its preferences must have spread out in a series of waves or swarms. Crossing at first by means of their canoes over the comparatively short stretches of sea between the Malay Peninsula and the neighboring islands, they gradually pushed out adventurously until they had occupied almost all the land space of the Pacific Ocean. "Some of the islands," Dr. Blake thinks, "they probably found unoccupied (but) in others they must have come in contact with an inferior black race similar to that inhabiting Papua and Australia, as is shown by the remnants of this race which are found pushed back into the interior mountain ranges of some of the larger islands, notably the Philippines."

Evidently the oldest colonies—or, more strictly, independent settlements—were those of the Philippines, because these islands lay nearest to the birthplace of the Malay fortune-hunters. The Malay tongue, then, embracing the languages of the Malay Peninsula, of the Philippines, of the East India Islands, of Madagascar, etc., is a branch of the Malayo-Polynesian linguistic family; and the Philippine idioms, dialects, or, as we have said above, "languages," are as a matter of fact the local manifestations of the expression-impulse which must be studied sometime, for purpose of comparison, in southern islands of the widest oceanic areas.

Dr. Blake (see *Bibliography*) writes that, beginning at the extreme north of the Archipelago, the languages about which anything definite is known are as follows: Batan is the language of the Batan and Babuyan islands to the north of Luzon. On the island of Luzon, Tagalog, the most important and best known of the Philippine languages, is spoken from coast to coast, in the middle region of the island, in the latitude of Manila Bay. On the west coast its territory does not extend north of the bay, but on the east it reaches as far north as the province of Isabela. On the south and southeast it extends down into the land's end of Luzon, trenching on the domain of Bikol. In the region north and west of the Tagalog district a number of languages are spoken. Ibanag prevails in the northeast, in the valley of the Cagayan River; Ilokan occupies the north and west coasts, extending as far south as the Gulf of Lingayen, between which and Manila Bay are heard the Pangasinan, Tino or Zambal, and the Pampangan tongues. Various Igorot dialects are spoken in the highlands of the interior.

On the Visayan Islands and on the north and east coasts of Mindanao, Visayan (Bisayan) is spoken in a number of different dialects. Sulu is the Moro tongue in the islands which extend from Mindanao westward. Moro tribes of Mindanao, in the west and southwest of that large island, speak two dialects known as Magiudanao and Malano. Of the other idioms spoken on Mindanao, only Bagobo and Tiruray are mentioned by Blake. The island of Mindoro forms the domain of the Mangyan tongue. The principal language of the Calamianes and the long narrow island of Palawan, which together form a chain stretching from Mindoro toward Borneo, is Tagbanwa. The tribes that speak these languages fall into three

general groups, according to their religion. Those that speak Batan, Ibanag, Ilokan, Pangasinan, Zambal, Pampangan, Tagalog, Bikol, Visayan, Agutayan and Koyuvan are Christians, the Sulus, Magindanaos and Malanaos are Mohammedans; while the remaining tribes mentioned are still pagans. The three alphabets used by natives of the Philippines are: (1) That of the pagan Tagbanwas and Mangyans. (2) That of the Mohammedan tribes, namely, the Arabic alphabet with additional signs to denote peculiar native sounds. (3) The Roman alphabet introduced by Spaniards, in which are written all languages of the Christian tribes and all those dialects of pagan tribes which have been reduced to writing by Spanish missionaries. At the time of the Spanish conquest the chief tribes possessed alphabets that were practically identical with those of the Tagbanwas and Mangyans; but those ancient alphabets have been superseded so completely that, in the Mohammedan tribes, no trace of them has been preserved, and their use in the Christian tribes seems to have died out more than 150 years ago. "The archetype of these native alphabets seems to have been," Blake observes, "of Indian origin. As in the Indian alphabets, every consonantal character without addition represents the consonant followed by the vowel *a*, the other vowels being indicated by secondary marks. There was no way of expressing a consonant without a following vowel." The Roman alphabet, used in writing the native languages, was conformed to the peculiarities of Spanish orthography, but lately a number of improvements in spelling have been introduced, the most important being the use of *k* for *c* and *qu*, and *w* for consonantal *u*. To some extent the Philippine languages have been influenced by the languages with which they have come in contact. The vocabularies of Tagalog and Bisayan (Visayan), for example, contain a number of Sanskrit words. Again, the languages spoken by the Mohammedan tribes contain a number of Arabic words. The Christian tribes have adopted Spanish terms; a few Chinese words are heard in Tagalog; and, of course, "at present the various languages are being subjected to the influence of English, and English words will probably be more or less extensively borrowed." The most important characteristics which the Philippine languages possess in common are given in the *Journal of the American Oriental Society*, Vol. XXVII, second half, pages 323-396.

Bibliography.—Beyer, H. O., 'Population of the Philippine Islands in 1916' (Manila 1917); Blake, F. R., 'Contributions to comparative Philippine Grammar,' *Journal of the American Oriental Society* (New Haven 1907); 'The Subanu' (Washington 1913).

MARRION WILCOX.

PHILIPPINES, University of the, an institution for higher education founded by the legislature in 1908 at Manila. It comprises the College of Liberal Arts, College of Medicine, College of Law, Pharmacy School, College of Veterinary Science School of Education, and School of Fine Arts, and a College of Agriculture at Los Barros, Laguna. The institution is governed by a board of 11 regents, of whom five are appointed by the governor-general, and the remainder hold office ex-officio. The annual enrolment is about 5,000.

PHILIPPITE, a mineral belonging to the group of Zeolites, formerly regarded as orthorhombic, but now ascertained to be monoclinic in crystallization. Crystals always twinned. Hardness, 4-4.5; specific gravity, 2.2; lustre, vitreous; color, white; translucent to opaque. Composition: $(\text{CaK}_2)\text{Al}_2\text{Si}_2\text{O}_{14}\cdot\text{H}_2\text{O}$. Occurs in vesicular cavities in old igneous rocks.

PHILIPPIMUM, in chemistry, an element closely allied to cerium. Though described by Delafontaine in 1888 as a newly discovered element, it was not until 1897 that it was acknowledged to be such by English chemists. Philippium has been found in gadolinite, samarskite and fergusonite. It appears in two sets of compounds, the philippous and the philippic, corresponding to a white acid and an orange oxide. The salts of the first series are colorless, quite stable, crystallize well, and correspond to the lanthanum and yttrium salts. Philippic oxide has a deep orange-red color. The constitution of philippium compounds remains to be established.

PHILIPPPOPOLIS, Bulgaria, the second largest city of the country and once the capital of eastern Rumelia situated on the Maritza River, 80 miles southeast of Sofia, on the railroad connecting the latter city with Constantinople. It is well laid out; has fine parks and suburbs, and is the seat of an archbishop of the Eastern Church. There are several Christian churches and mosques, a college and a national library. The city is the chief commercial point of central Bulgaria, with a huge trade in silk, cotton goods, attar of roses, grain, rice, hides and tobacco. It is an ancient city of Thrace and has suffered much in the course of the centuries from the tide of war in which it was several times engulfed. In 1818 an earthquake well-nigh destroyed it and a disastrous fire occurred in 1846. Pop. 47,000.

PHILIPPOTEAUX, fê-lê-pô-tô, **Henri Emmanuel Félix**, French painter: b. Paris, 3 April 1815; d. there, 9 Nov. 1884. After studying his art under Cogniet he applied himself to the painting of battle scenes, and his canvases give a vivid and almost complete panorama of 19th century wars. His mastery of details and lively delineation of the clash and movement of combat are remarkable. Among his principal pictures are 'The Evacuation of Moscow' (1835); 'The Capture of Ypres'; 'The Siege of Antwerp in 1792' (1838); 'Louis XV Visiting the Battlefield of Fontenoy' (1840), in the Luxembourg; 'The Battle of Rivoli' (1845); 'Charge of the Chasseurs d'Afrique at Balaklava' (1859); 'The Siege of Puebla' (1865); 'The Meeting of Henry IV and Sully after the Battle of Ivry, 1590' (1875), now in the museum at Versailles; 'Bayard on the Bridge of Garigliano, 1503'; 'The Battle of Alma' (1875); 'A Panorama of the Siege of Paris, 1870-71'; and several other war panoramas.

PHILIPPSBURG, Germany, a town in Baden on the right bank of the Rhine, 16 miles north of Carlsruhe, formerly a celebrated imperial fortress. In 1734 it was captured by the French under the Duke of Berwick (who lost his life here), and its fortifications were razed in 1800. Pop. about 2,500.

PHILIPPSON, fê-lêp-zôn, **Martin**, German historian: b. Magdeburg, Germany, 27 June 1846. He was educated at Bonn and at Berlin,

became docent at Bonn in 1871, and in 1878 was appointed to the chair of history in the University of Brussels. A bitter controversy arose with the anti-German student body in 1890, and Philippson resigned his professorship. He wrote 'Geschichte Heinrichs des Löwen' (1868); 'Geschichte des preussischen Staatswesens vom Tode Friedrichs des Grossen bis zu den Freiheitskriegen' (1880-82); 'Das Leben Kaiser Friedrichs III' (1900); 'Kurfürst Friedrich Wilhelm von Brandenburg' (1879-1901), etc.

PHILIPS, fil'ips, Ambrose, English poet: b. Shropshire, 1675; d. London, 18 June 1749. He was graduated from Cambridge in 1696, and removed to London, where he became intimate with Addison and Steele. His 'Winter-piece,' published in the *Tatler*, first gained him recognition; his six 'Pastorals,' which appeared in Tonson's 'Miscellany' (1709), gained the praise of Tickell, but roused a bitter satirical attack from Pope. Some of his odes written to children contain really his best work, but their simplicity of diction earned for him the nickname "Nabby-Pamby," since become an adjective in general use. He established the *Free-Thinker* in 1718, and supported the government in its columns, later sat in the Irish Parliament for Armagh, was secretary to the lord-chancellor of Ireland in 1726, and judge of the Prerogative Court in 1733. His play, 'The Distrest Mother' (1712), adapted from Racine's 'Andromaque,' received high praise from the *Spectator*, but 'The Briton' (1722), and 'Humphrey, Duke of Gloucester' (1723), attracted little attention. Consult Johnson, 'Lives of the Poets.'

PHILIPS, Edward, English author: b. London, August 1630; d. there, about 1696. He was educated under the care of his uncle, John Milton, and studied for a time at Oxford. Later, with his brother, John (1631-1706), who had been Milton's assistant as Latin secretary to Cromwell's government, he joined the Cavalier party, which proceeding resulted in an estrangement from his uncle. He engaged in literary work, edited a volume of poems by William Drummond, and supported himself by literary hack work and tutoring in noble families. Subsequently he became reconciled to his uncle and was a warm admirer of his work. He wrote 'New World of English Words' (1658); 'Mysteries of Love and Eloquence' (1658); 'Theatrum Poetarum' (1675); 'Life of Milton' (1694), etc.

PHILIPS, Francis Charles, English novelist and dramatist: b. Brighton, Sussex, 3 Feb. 1849. He was educated at Brighton College, entered the army, where he served three years, became a barrister in 1884, and began writing novels and plays. His novel, 'As in a Looking Glass' (1885), was dramatized and played by both Sarah Bernhardt and Mrs. Beere. He collaborated in writing the plays 'A Woman's Reason'; 'The Fortune of War'; 'Papa's Wife'; etc., and among his numerous novels are 'The Dean and His Daughter,' dramatized 'Mrs. Bouverie'; 'The Luckiest of Three'; 'Men, Women and Things'; 'A Devil in Nun's Veiling'; 'A Full Confession'; 'My Varied Life' is a volume of reminiscences.

PHILIPS, George Morris, American educator: b. Atglen, Pa., 28 Oct. 1851. He was graduated from Bucknell University, Lewis-

burg, Pa., in 1871, and has been principal of the Pennsylvania State Normal School, Westchester, Pa., from 1881. He has published 'Astronomy' (1882); 'Natural Philosophy' (1884); 'Civil Government of Pennsylvania' (1893); 'Geography of Pennsylvania' (1895); 'Nation and State' (1907); 'The Silver-Burdett Arithmetics' (with Anderson).

PHILIPS, or PHILLIPS, John, English poet: b. Bampton, Oxfordshire, 30 Dec. 1676; d. Hereford, England, 15 Feb. 1709. He was educated at Winchester and Oxford, and won his first literary success on the publication of his 'Splendid Shilling,' written in blank verse in imitation of Milton. His 'Cyder' was also an imitation, after Virgil's *Georgics*, and 'Blenheim,' which was a Tory celebration of Marlborough's victory, was written in reply to Addison's 'Campaign.' He is the only notable writer in blank verse between Milton and Thomson.

PHILIPS, Katherine Fowler, English poet: b. London, 1 Jan. 1631; d. there, 22 June 1664. She was married to Hector Philips in 1647 and afterward accompanied the Viscountess Dungannon to Ireland. On her return to London she became a member of the famous literary circle which included Jeremy Taylor and Sir Charles Cotterel and was known among them as "the matchless Orinda." Her translation of Corneille's 'Pompée' was very successful and was acted in 1663-64. An unauthorized edition of her poems was printed in 1663 and her letters to 'Poliarchus' (Sir Charles Cotterel) were published in 1705. Consult Gosse, 'Seventeenth Century Studies' (1883).

PHILIPSBURG, Pa., borough in Center County, on the Mushannon Creek, and on the New York Central and Hudson River, the Pennsylvania, and the Pittsburgh and Susquehanna railroads, 40 miles northeast of Altoona. Great quantities of bituminous coal are mined nearby and there are also great deposits of clay in the neighborhood. Its industrial establishments include flour mills, foundries, planing mills, manufacturing of hardware and tools, and machine shops. There are two sanatoria and it is also the seat of Cottage State Hospital. Pop. 3,900.

PHILIPSON, fil'ip-sôn, David, American rabbi: b. Wabash, Ind., 9 Aug. 1862. He was graduated from the University of Cincinnati and from the Hebrew Union College there in 1883. In 1884-88 he was rabbi of the Har Sinai Congregation in Baltimore, and has since been in charge of the B'né Israel Congregation, Cincinnati, and professor of homiletics in the Hebrew Union College there. He was president of the Central Conference of American Rabbis 1907-09 and has been a member of the executive committee since then. He was a consulting editor of the Jewish encyclopedia and is a member of the board of editors of the new Jewish Bible translation. He is prominently connected with various charitable and other associations and has published 'The Jew in English Fiction' (1889, 1902, 1911); 'Five Lectures on Cuneiform Inscriptions' (1890); 'Old European Jewries' (1894); 'The Oldest Jewish Congregation in the West' (1894); 'A Holiday Sheaf' (1898); 'Reminiscences by Isaac M. Wise' (1901); 'The Reform Movement in Judaism' (1907); 'Max Lilienthal, American Rabbi' (1915), besides many pamphlets.

PHILISTINES, *fi-lis'tinz* (Hebrew, *Philisthiim*), a people who appear to have settled in the coast plain of Canaan shortly before the arrival of the Israelites; whence they migrated is a question which historical and archaeological research has as yet failed to resolve. Some historians trace their origin to the island of Crete, others hold that they came from the borders of Egypt, the land of Gerar. Their territory, called *Philistia* or land of the *Philisthiim*, gave, in after times, to the whole country at any period occupied by Israel the name it still bears, Palestine. They occupied four principal cities from the neighborhood of Joppa on the north, southward to the Egyptian border, namely, Azotus (Ashdod), Gaza, Ascalon (Ashkelon)—these on the Mediterranean Coast; and Gath and Ekron inland. These five cities, under as many lords, were always confederated for war, offensive or defensive, against foreign enemies. Throughout the period of the Judges in Israel this confederacy was at almost continual war with the Israelites, and despite the consolidation of the military resources of the Hebrew people under the kingship, the ascendancy of *Philistia* seemed assured before the close of Saul's reign. But David carried the war into the *Philistine* country and with notable success; his son Solomon completely subdued *Philisthiim* and made the country tributary to Israel. Even after the division of Israel into two kingdoms the *Philistines*, though they were a serious menace to the northern kingdom, for some time did not dare to attack the kingdom of Judah; but in the reign of Aheaz, the 11th of the Judaite kings, they reconquered some of their ancient possessions. In the time of the Maccabees the Jews once more asserted mastery over their ancient rivals; afterward *Philistia* was annexed by Pompey to the Roman province of Syria. The origin of the *Philistines* is a much vexed question. That they were of Semitic race or that they were at least a semitized people, has been with strong probability inferred from such remains of their language as are extant. First, the names of their cities, which are unquestionably semitic; but are the names we have the very names given to the cities themselves, or are they names given them by their Semitic neighbors? If the question had to be resolved by means solely of the names given in the Hebrew sacred books, the solution would be open to doubt; but the modern study of the Assyrian monuments has discovered a great many other proper names of persons and places—to say nothing of analogies in religious beliefs; and these give abundant proof that the *Philistines* were, at least in language, Semitic.

PHILISTINISM, a term of contempt to designate the manners, habits of thought, and views of life held by persons of inferior culture. The word *Philistine* (*Philister*) was first employed in some such sense as this by German university students; for them all classes outside of university circles are *Philister*. Matthew Arnold attributes *Philistinism* to the whole middle class of the English people, who are, he says, ignorant, strenuously obstructive and narrow-minded. But Sir Leslie Stephen recognized in the use of the word the very note of *Philistinism*; "*Philistine*," he says, "is a term of contempt applied by prigs to the rest of their species."

PHILISTUS, a Greek historian who resided at the court of Dionysius the Elder, tyrant of Syracuse (430–367 B.C.), and wrote a history of his life. The work has not come down to our time; it is quoted by Pausanias.

PHILLEO, *fil-ē'ō*, Prudence Crandall, American philanthropist: b. Hopkinton, R. I., 3 Sept. 1803; d. Elk Falls, Kan., 28 Jan. 1889. In 1831, with the aid of several residents, she opened at Canterbury, Windham County, Conn., a school for young ladies. She received a colored pupil, and thereby aroused the disapproval of her Canterbury neighbors, who declined to help sustain the school if the objectionable member were retained. Upon her refusal to dismiss the colored pupil, the white scholars left, and she then determined to teach blacks only. In April 1833 her new enterprise was begun. Upon petition of the townspeople, an act was passed by the legislature making unlawful the establishment of young ladies' schools for colored pupils not resident in the State, and in the succeeding autumn she was twice tried and convicted. In 1834 the judgment was reversed by the Supreme Court of Errors. During the two years struggle with the town of Canterbury, she was subjected to ostracism and spiteful persecution, and her house was even set on fire. Soon afterward she was married to Rev. Calvin Philleo, and with him removed from Connecticut. Consult May, 'Recollections of the Anti-Slavery Conflict' (1869).

PHILLIMORE, *fil'i-mōr*, John George, English jurist: b. Oxfordshire, 5 Jan. 1808; d. Shiplake House, Oxfordshire, 27 April 1865. He was educated at Westminster and Oxford, was called to the bar of Lincoln's Inn in 1832, became eminent in his profession and member of Parliament in 1852–57. He published 'Introduction to the Study and History of Roman Law' (1848); 'Private Law Among the Romans: Principles and Maxims of Jurisprudence'; etc.

PHILLIMORE, Sir Robert Joseph, English jurist, brother of J. G. Phillimore (q.v.): b. London, 5 Nov. 1810; d. Henley-on-Thames, 4 Feb. 1885. He was educated at Oxford, was called to the bar in 1841 and rapidly came to the front in his profession. He sat in Parliament for Tavistock 1852–57; in 1867 was appointed judge of the High Court of Admiralty, and in 1871–72 was judge-advocate-general. He was knighted in 1862 and created a baronet in 1881 and two years later resigned his judgeship. His works include 'Commentaries on International Law' (1854–61); 'The Ecclesiastical Law of the Church of England' (1873); and a translation, with notes, etc., of Lessing's 'Laocöon' (1874).

PHILLIMORE, Sir Walter George Frank, English jurist: b. London, 21 Nov. 1845. He was educated at Oxford, became a barrister of the Middle Temple in 1868 and received the patent of precedence in 1883. He was a judge of the Queen's Bench Division of the High Court of Justice 1897–1913 and was one of the Lords of Appeal 1913–16. He is vice-president of the English Church Union. He edited Robert Phillimore's 'Ecclesiastical Law of the Church of England' and 'International Law,' and wrote 'Book of Church Law.'

PHILIP, fil'ip, John, Scottish painter: b. Aberdeen, Scotland, 19 April 1817; d. London, 27 Feb. 1867. While a boy in distressing poverty, he cultivated his natural taste for painting and at the age of 13 received instruction from a local portraitist. Before his 15th year he produced portraits which won for him the patronage of Lord Panmure and the means of pursuing his art studies in London as a student at the Royal Academy. His subjects were at first all Scotch,—‘A Scotch Fair,’ ‘A Scotch Washing,’ etc., or in individual portraits. A visit to Spain for his health's sake in 1851 resulted in a distinct change both of style and subject and thenceforth his standing among the foremost British artists was assured; he subsequently made two further visits to Spain and also spent three months at Rome. Among his works are ‘The Letter-writer of Seville’; ‘The Spanish Contrabandista’; ‘The Early Career of Murillo’; ‘La Bomba’; ‘La Gloria’; ‘El Cigarillo’; ‘The Marriage of the Princess Royal.’

PHILLIPIUM, in chemistry, a rare element belonging to the yttrium group. Discovered by Delafontaine (1878) in a sample of the mineral samarskite obtained from North Carolina, it appears to form two series of compounds, the phillipous and the phillipic, but the chemistry of these substances and even the elementary nature of the so-called phillipium itself needs further confirmation.

PHILLIPPS, fil'ips, Sir Thomas, English book-collector: b. Manchester, England, 2 July 1792; d. Cheltenham, England, 6 Feb. 1872. He studied at Rugby and Oxford, early evinced a taste for collecting valuable books and manuscripts and devoted his entire life to his collections, which exceeded 60,000 books and manuscripts and a large number of old coins and pictures. In 1821 he was created a baronet, and in 1822 established a printing-press on his estate, from which he issued publications important to collectors. His eldest daughter was married to James Orchard Halliwell, the Shakespearean scholar, who upon succeeding to Sir Thomas' estates changed his name to Halliwell-Phillipps (q.v.). The vast collection was bequeathed to the youngest daughter, but much of it is now scattered.

PHILLIPS, fil'ips, Adelaide, American singer: b. Stratford-on-Avon, England, 26 Oct. 1833; d. Carlsbad, 3 Oct. 1882. At seven she removed with her family to Boston, and at the Boston Museum, 25 Sept. 1843, made her début as Little Pickle in ‘The Spoiled Child.’ She afterward appeared as a juvenile danseuse at Barnum's Museum in New York, under the name of ‘the Child of Avon.’ At the Boston Museum she subsequently played soubrette parts, and in 1846 appeared at the Walnut Street Theatre, Philadelphia, as Rosa in ‘John of Paris.’ In 1852, having developed a contralto voice of rare qualities, on the advice and with the practical assistance of Jenny Lind, she went to Italy for study. After two years she returned to the United States, having meanwhile (1853) made a successful début in ‘Semiramide’ in Brescia. She appeared in concert in Boston (1854), and made her first American appearance in opera 17 March 1856, at the Academy of Music, New York, as Azucena in ‘Il Trovatore.’ She sang in the Italian Opera House, Paris, in 1861, and after-

ward in all the chief cities of the world. For many years she was the foremost of American contralto singers. Consult biography by Waterston (1883).

PHILLIPS, David Graham, American novelist: b. Madison, Ind., 1867; d. New York, 24 Jan. 1911. In 1887 he was graduated at Princeton University and at once entered the field of journalism. In New York he was first on the staff of the *Sun*; next he became London correspondent of the *World*, after which he was for a time private secretary to Joseph Pulitzer, owner of the *World*. In 1901 he published his first novel ‘The Great God Success,’ which at once brought him into general notice as a story-teller of marked ability. He dealt largely in his books with the burning problems of the day and was always interesting, informing and entertaining. His best works are ‘The Second Generation’ (1907); ‘Old Wives for New’ (1908); ‘Hungry Heart’ (1909); ‘Her Serene Highness’ (1902); ‘Golden Fleece’ (1903); ‘The Social Secretary’ (1905); ‘The Fortune Hunter’ (1906); ‘Light-Fingered Gentry’ (1907); ‘Worth of a Woman’ (1908); ‘The Husband's Story’ (1910); ‘The Grain of Dust’ (1911). Consult Cooper, F. T., ‘Some American Story-Tellers’ (New York 1911) and Underwood, J. C., ‘Literature and Insurgency’ (ib., 1914).

PHILLIPS, George Searle (“JANUARY SEARLE”), American author: b. Peterborough, England, January 1815; d. Morristown, N. J., 14 Jan. 1889. He was educated at Cambridge, came to New York, and engaged in journalism, but returned to England in 1845. He was editor of the Leeds *Times*, principal of the People's College, Huddersfield, England, in 1846, and later came back to the United States, where he settled permanently. He edited the Chicago *Republican*, in conjunction with Charles A. Dana (q.v.), and afterward was literary editor of the New York *Sun*. In 1873 he became insane, and the remainder of his life was spent in an asylum. He wrote ‘Life of Ebenezer Elliott’ (1850); ‘Memoirs of Wordsworth’; ‘Emerson: His Life and Writings’; ‘The Gypsies of the Dane's Dyke’, etc.

PHILLIPS, Henry, American archæologist: b. Philadelphia, 6 Sept. 1838; d. there, 6 June 1895. He studied law and was admitted to the bar in 1859, but practised little, devoting his attention chiefly to numismatics, archæology, etc. He published ‘History of American Colonial Paper Currency’ (1865); ‘History of American Paper Money’ (1866); ‘Pleasures of Numismatic Science’ (1867); ‘Poems from the Spanish and German’ (1878); a translation of Chamisso's ‘Faust’ (1881); and four volumes of translations from the Spanish, Hungarian and German (1884–87).

PHILLIPS, Henry Myer, American lawyer and politician: b. Philadelphia, 30 June 1811; d. 3 Aug. 1884. He was admitted to the bar in his native city in 1832, turning his attention with much success to criminal and civil practice. In 1856 he was elected as a Democrat from the fourth district of his State, to the 35th Congress. After the expiration of his term, he accepted many positions in educational, charitable and financial institutions, became a commissioner of the Board of City Trusts, hav-

ing control of the Stephen Girard estate, and was made president of that board and president as well of the board of directors of the Academy of Music, Fairmount park commission, and director of numerous corporations. He served also as Grand Master of Freemasons of the State.

PHILLIPS, John, American educational benefactor: b. Andover, Mass., 6 Dec. 1719; d. Exeter, N. H., 21 April 1795. He was a son of Samuel Phillips (1690-1771), was graduated from Harvard in 1735, and after studying theology preached for a time. He was afterward a merchant at Exeter, and for several years one of the New Hampshire council. In 1778 he assisted in founding Phillips Academy at Andover, and in 1781 he founded Phillips Academy at Exeter. He was also a benefactor to Dartmouth College.

PHILLIPS, John, English geologist: b. Marden, Wiltshire, 25 Dec. 1800; d. Oxford, England, 24 April 1874. He was educated under the supervision of his uncle, William Smith, the geologist, with whom he engaged in geological investigations in England. In 1834 he accepted the chair of geology at King's College, London, receiving an appointment to the same position at the University of Dublin in 1844 and at Oxford in 1856. He was keeper of the Ashmolean Museum 1854-70, in 1859-60 president of the Geological Society and of the British Association in 1865. He wrote 'Guide to Geology' (1834); 'Memoirs of William Smith' (1844); 'Vesuvius' (1869); 'The Geology of Oxford and the Valley of the Thames' (1871), etc.

PHILLIPS, John Arthur, English geologist: b. Polgooth, Cornwall, 18 Feb. 1822; d. London, 4 Jan. 1887. He was graduated from the École des Mines, Paris, in 1846. In 1848-68 he was a mining engineer and metallurgist in London, acted as chemist to the Admiralty Commission, and in 1848-50 was professor of metallurgy at the college for civil engineers at Putney. He inspected the California gold mines in 1853 and later years, and wrote 'The Mining and Metallurgy of Gold and Silver' (1867); 'Elements of Metallurgy' (1874); 'A Treatise on Ore Deposits' (1884), etc.

PHILLIPS, Philip, American jurist: b. Charleston, S. C., 17 Dec. 1807; d. Washington, 14 Jan. 1884. He studied law in Charleston; was admitted to the bar at 21; and was a member of the State constitutional convention of 1832, known as the Nullification convention. Elected to the State legislature in 1834, he resigned in 1835 and removed to Mobile, Ala., where he practised his profession. He was president of the Alabama State convention in 1837; in 1844 was elected to the State legislature, and re-elected in 1852; was member of Congress from Alabama from 1853-55, and declining re-election he removed to Washington, D. C., and practised law until the Civil War, when he went to New Orleans, La. After the war he returned to Washington, where he resided until his death. In 1840 he prepared a 'Digest of Decisions of the Supreme Court of Alabama,' and was the author of 'Phillips' Practice of the Supreme Court of the United States.' As one of the eminent lawyers of his time, he was connected with some of the most noted law cases of the country.

PHILLIPS, Philip, American Methodist evangelist and singer: b. Chautauqua County, N. Y., 13 Aug. 1834; d. Delaware, Ohio, 25 June 1895. In 1861 he opened a music store in Cincinnati, and during the Civil War held song services in many northern cities to aid the Christian Commission, and in 1866 was musical editor of the Methodist Book Concern. In 1868 he visited England, where he sang 200 nights for the Sunday School Union, and prepared for them 'The American Sacred Songster,' of which 1,100,000 copies were sold. He traveled with D. L. Moody (q.v.), and in 1872 made a singing tour of the world. He published 'Spring Blossoms' (1865); 'Hallowed Songs' (1871); 'Our New Hymnal' (1894), etc.

PHILLIPS, Samuel, American colonial clergyman: b. Salem, Mass., 17 Feb. 1690; d. Andover, Mass., 5 June 1771. He was graduated at Harvard in 1708, studied theology and was ordained pastor of the Second or South Parish Church of Andover, in 1711, a pastorate which he held till his death. He was a notably strict Calvinist in his theology. His brother, John, was the great-grandfather of Wendell Phillips (q.v.), and his grandson, Samuel Phillips, was the founder of Phillips Academy at Andover.

PHILLIPS, Samuel, American lawyer and legislator: b. North Andover, Mass., 7 Feb. 1752; d. Andover, Mass., 10 Feb. 1802. He was a grandson of Samuel Phillips (1690-1771) (q.v.), and was the fifth of the name. He was graduated at Harvard in 1771. He succeeded his father as town clerk of Andover in 1773, was a member of the provincial congress 1775-80, and of the Massachusetts constitutional convention, 1779-80. He sat in the State senate 1780-1801 (excepting in 1787-88), was lieutenant-governor 1801-02, and justice of the court of Common Pleas for Essex County, 1781-98. He is best known as the founder of Phillips Academy, a project conceived by him soon after leaving college and to the furtherance of which he induced his uncle, John Phillips (q.v.), the founder of Phillips Academy at Exeter, to contribute. (See PHILLIPS (ANDOVER) ACADEMY). His daughter, Mary, was the mother of Bishop Phillips Brooks (q.v.). After his death his wife assisted in the founding of Andover Theological Seminary.

PHILLIPS, Stephen, English poet: b. Somertown, near Oxford, 28 July 1868; d. 9 Dec. 1915. He abandoned an Oxford career to go on the stage in Frank Benson's company, in which he played in his time many parts and gained the experience which later was so greatly to aid him in the dramatic construction of his works. His first serious effort, 'Eremus' (1894), though praised by Stopford Brooke and Addington Symonds, attracted little general notice. It was later withdrawn by the author. 'Christ in Hades and Other Poems' (1896) found generous eulogists, but it was not until his 'Poems' (1897), a small collection, was crowned by the 'Academy' as the best work of the year with the first prize of 100 guineas, that Phillips achieved a reputation. In his later works he successfully revived the English poetic drama. Some discerning critics have regarded certain of the 'Poems' as his finest work, but the dearth of poetry in the English drama gave to 'Paolo and Francesca'

(1899); 'Herod' (1900), and 'Ulysses' (1902), and 'The Last Heir' (1908), a greater interest. Ulysses was presented in the United States in 1903. His other works include 'New Poems' (1903); 'The Sin of David' (1904); 'Nero' (1906); 'Pietro of Siena' (1910); 'The New Inferno' (1910); 'The King' (1912); 'Lyrics and Dramas' (1913); 'Iole' (1913); 'Armageddon' (1915); 'Panama' (1915). See HEROD; PAOLO AND FRANCESCA.

PHILLIPS, Thomas, English painter: b. Dudley, Worcestershire, 18 Oct. 1770; d. London, 20 April 1845. He was an early pupil of Edington, the glass-painter at Birmingham, and worked as his assistant until 1790, when he went to London and was employed by West in executing a design for the windows in Saint George's Chapel, Windsor. Soon afterward he began to devote his time to portraits and became one of the most fashionable portrait painters of his day, in spite of the competition of Sir Thomas Lawrence, as well as of Hoffner, Shee, Owen and Beechey. His 'Venus and Adonis' (1808) secured his election as a Royal Academician, and in 1825 he was appointed Fuseli's successor as professor of painting at the Royal Academy. His lectures were published in 1833. He was very successful in catching a likeness, and his portrait of Napoleon, painted by stealth with the connivance of the Empress Josephine, is now at Petworth, and has been frequently engraved; that of David Wilkie by him is in the National Gallery. He also painted well-known likenesses of Lord Byron and Sir Walter Scott, as well as of Crabbe, Chantrey, Southey, Coleridge, Campbell, Rogers and Sir Humphrey Davy.

PHILLIPS, Thomas W., American capitalist and legislator: b. Mount Jackson, Pa., 1835; d. 1912. He acquired vast interests in oil wells and was one of the largest individual oil producers of the country. He was also interested in politics and during the Garfield campaign of 1880 originated the campaign textbook. From 1893 to 1897 he was a member of Congress, where he introduced the bill creating the Industrial Commission. He served on the newly-formed Commission and in 1902 submitted a supplementary report which resulted in the creation of the Bureau of Corporations.

PHILLIPS, Ulrich Bonnell, educator and economist: b. La Grange, Ga., 4 Nov. 1877. He graduated at the University of Georgia, A.B., 1897; A.M., 1899; and there was Fellow and tutor in history 1897-1900. In 1901 he was awarded the Justin Winsor prize of the American Historical Association. From 1900-02 he was Fellow of Columbia University, where he received his Ph.D. degree in 1902. He was instructor in history 1902-07 and assistant professor 1907-08 at the University of Wisconsin; professor of history and political science, Tulane University 1908-11; and from 1911 professor of American history at the University of Michigan. He also acted as research assistant at the Carnegie Institution of Washington, 1904-06; was collaborator of the American Bureau of Industrial Research 1905-09; was army camp educational director, Y.M.C.A., Camp Gordon, 1917; and is associate of many learned societies. He came into international prominence as the author of numerous articles on the economics of slavery,

on the plantation system and ante-bellum politics. He edited 'Plantation and Frontier Documents' (1909); 'The Correspondence of Robert Toombs, Alexander H. Stephens and Howell Cobb' (1913); and is author of 'Georgia and State Rights' (1902); 'History of Transportation in the Eastern Cotton Belt' (1908); 'Life of Robert Toombs' (1913); 'History of American Negro Slavery' (1918).

PHILLIPS, Wendell, American orator and reformer: b. Boston, 29 Nov. 1811; d. there, 2 Feb. 1884. He was graduated from Harvard in 1831, a classmate of J. L. Motley (q.v.). After three years' study at the Harvard Law School he was admitted to the bar in 1834; but he took slight interest in the legal profession. On 21 Oct. 1835 he saw Garrison (q.v.) dragged through the streets of Boston by those "gentlemen of property and standing," as the press styled them, who had been disappointed in their original purpose of bringing George Thompson (q.v.) to the tar-kettle. From that time he was an Abolitionist, with which interest he identified himself in 1836. He came at once into prominence by his great Faneuil Hall speech of 8 Dec. 1837. Through the efforts of W. E. Channing a meeting had there been assembled suitably to protest against the murder of E. P. Lovejoy (q.v.) at Alton, Ill., while defending the freedom of the press against a pro-slavery mob. But the entire purpose of the gathering seemed likely to be defeated by James T. Austin, a parishioner of Channing and attorney-general of Massachusetts, who, in a singularly absurd outburst likened the Alton rabble to the patriots of the Revolution and declared that Lovejoy had perished "as the fool dieth." It appeared not improbable that these most ill-considered remarks might divide the audience, when Phillips, by invitation, took the platform and made answer. "When," he said, as he began that stinging rebuke, "I heard the gentleman lay down principles which placed the rioters, incendiaries and murderers of Alton side by side with Otis and Hancock, with Quincy and Adams, I thought those pictured lips (here indicating the portraits in the hall) would have broken into voice to rebuke the recreant American, the slanderer of the dead." Phillips became forthwith the chief of American orators and the apostle of the Garrisonian school of abolition. He accepted the creed of Garrison almost without condition, though he became but gradually a disunionist and was never a non-resistant. In 1839 he withdrew from professional practice, being unwilling to bind himself by the advocate's oath of fealty to the Constitution. Later, for a similar reason, he declined Congressional candidacy. With Garrison he opposed in 1839-40 the attempt to debar any from the anti-slavery platform on the ground of differences in religious faith, and the organization of the Abolitionists into a political party. He disagreed, however, with Garrison in 1864 in regard to Lincoln's re-election, which he did not favor; and in 1865, respecting the discontinuance of the Anti-Slavery Society, which Garrison held then to have concluded its mission. Phillips believed that the education and enfranchisement of the negro ought to be accomplished, and was elected in Garrison's place to the presidency of the society, a post which he held until the disbandment, 9 April 1870, con-

WENDELL PHILLIPS

sequent upon the passage of the 15th amendment. But his activities did not now pause here. He thought the task of reform was never done, and on this idea placed a most valuable emphasis. So he spoke for the Indian, for the Irish, for improvements in the criminal law and prison administration, for women suffrage, for legislative control of the sale of liquor and against accumulations of corporate wealth dangerous to the State. In all these causes Phillips was never even remotely the demagogue, though at times his associates may have been such. He received in 1870 about 20,000 votes as labor-reform and temperance candidate for the governorship of Massachusetts. He was known also for years as one of the kings of the American lyceum, among his most famous addresses being 'The Lost Arts,' 'Toussaint l'Ouverture' and 'Daniel O'Connell.' Among his occasional orations may be mentioned that in memory of Theodore Parker (q.v.) and that on 'The Scholar in a Republic,' given in 1881 at the centennial of the Harvard Phi Beta Kappa. A scholar himself, in the narrower acceptance, Phillips was not. The course of his activities did not allow this; but he was a considerable reader, appropriated to his own uses all that he studied and found ample supply of needful illustration in the history of the English Revolution of 1630, on which subject he had once read every work obtainable. Contemporary evidence as to his oratory is unanimous and places him with Webster and Everett. His method was far different from theirs; he replaced their rounded sonority by the easy, limpid and colloquial style which since his time has remained the type of the best American public speech. He spoke with much repose, did not lack for appropriate wit and was superb in sarcasm, epigram or invective. He surrendered worldly preferment to identify himself with a despised propaganda; he gained his fame and saw his victory against heavy odds, opposed to the inertia of a general prejudice. Many of his speeches were, as reports show, sword-play with a hostile audience. Of course, under existing conditions, he made mistakes, but his fine attainments were always finely used. He contributed to *Anti-Slavery Standard* and *The Liberator*, and wrote several pamphlets. A collection of his 'Speeches, Lectures and Letters,' edited by J. Ridpath, was published in 1864; a second series, by T. C. Pease in 1892. Consult Austin, G. L., 'Life and Times of Wendell Phillips' (new ed., Boston 1893); Martin, W. C., 'Wendell Phillips The Agitator' in 'American Reformers' (New York 1890); Russell, C. E., 'The Story of Wendell Phillips, Soldier of the Common Good' (Chicago 1914); Sears, Lorenzo, 'Wendell Phillips, Orator and Agitator' (New York 1909); also works treating of the anti-slavery period and its leaders.

PHILLIPS, William, American merchant, son of Samuel Phillips (1690-1771): b. 1722; d. 1804. He was a wealthy merchant of Boston, and becoming interested in the project of an academy at Andover as outlined by his nephew, Samuel Phillips (1751-1802), gave to it an amount equal to that contributed by his brother Samuel. He was a member of the Massachusetts legislature and held various political offices of importance.

PHILLIPS, William, American educational benefactor, son of William Phillips (1722-1804): b. Boston, Mass., 10 April 1750; d. there, 26 May 1827. He engaged in business with his father, became wealthy and was 12 times chosen lieutenant-governor of Massachusetts (1812-23). At his death he bequeathed large sums to Phillips (Andover) Academy and to Andover Theological Seminary.

PHILLIPS, William Addison, American soldier: b. Paisley, Renfrewshire, Scotland, 14 Jan. 1824; d. Fort Gibson, Okla., 30 Nov. 1893. He received an academic education prior to the migration of his father's family to America in 1838. He grew to manhood on a farm in Illinois. At the age of 22 he engaged in newspaper work and later began the study of law. In 1855 he went to Kansas as a special correspondent of the *New York Tribune*. Although he was offered a large salary to go to the front as a correspondent at the outbreak of the Civil War, he chose rather to enter the volunteer military service. He was commissioned major of the 1st Indian Home Guard regiment in 1862 and was soon promoted to the colonelcy of the 3d Indian Home Guard regiment. He commanded the Indian brigade, with headquarters at Fort Gibson, and for a time commanded a division, though never promoted above the rank of colonel. His position as the ranking Federal military commander in the Indian Territory during most of the time for two years was one which called for the exercise of energy, tact, diplomacy and administrative ability of a high order as well as a large degree of military skill. From 1873 to 1879 he represented the first Kansas district in Congress. Almost radically progressive in his views, he was a careful student of economics and sociology, as evidenced by his work, 'Labor, Land and Law,' which was published in 1886. After his retirement from Congress he served for some years as an attorney for the Cherokee Nation. He was buried at Salina, Kan., of which town he was one of the founders.

PHILLIPS (ANDOVER) ACADEMY, a celebrated college preparatory school for boys at Andover, Mass., founded 25 April 1778, opened 30 April 1778 and incorporated 4 Oct. 1780. It owes its existence to the initiative of Samuel Phillips (1751-1802). The property, originally conveyed to the academy trustees by Samuel Phillips (the elder) and his brother John, consisted of 141 acres with several buildings upon it, in Andover, 200 acres in Jaffrey, N. H., and some \$8,000 in cash. In 1785 a new academy building was erected, the gift of the three brothers, Samuel, John and William Phillips. The trustees of the academy were vested in 1807 with authority to receive and hold funds for a theological school and what is now known as the Andover Theological Seminary (q.v.) was founded the next year. The academy has grown to be one of the foremost institutions of its kind in this country, and in recent years its equipment has been very materially increased, the archaeological department with ample endowment and costly building being one of the most notable of recent gifts. The larger number of the students go to Harvard and Yale on leaving the academy, and the institution is, therefore, based on the require-

ments of those universities. It accommodates about 400 pupils. Its endowment now amounts to about \$500,000, and outside of invested funds the academy property amounts in value to \$500,000. There are 60,000 volumes in the several libraries of the institution. Consult Adams, 'Some Famous American Schools' (1903).

PHILLIPS (EXETER) ACADEMY, a noted American college preparatory school at Exeter, N. H., incorporated 3 April 1781, endowed by John Phillips, 9 Jan. 1782, opened 7 May 1783. The institution was the earliest of an educational character incorporated by the New Hampshire legislature, and was named in honor of its founder, John Phillips (q.v.), whose gifts to it totaled \$65,000. It accommodates 300 and odd students. Like the sister institution at Andover, it has prospered greatly in recent years, and many new and commodious buildings have been erected within the past decade, the most notable of these being the great dining hall, built in 1903. It has an endowment of \$400,000 and an annual income of \$100,000. Its alumni number about 10,000. A marked characteristic of the school is its thorough carrying out of the principle of self-government. Consult Adams, 'Some Famous American Schools' (1903).

PHILLIPSBURG, fil'ps-bërg, N. J., town in Warren County, on the Delaware River, and on the Central of New Jersey, the Pennsylvania, the Delaware, Lackawanna and Western, Lehigh and Hudson and the Lehigh Valley railroads, about 60 miles in direct line west of Newark. It was settled in 1749, and in 1861 was incorporated. It has good water power and excellent facilities for transportation. The chief manufacturing establishments are foundries and furnaces, railroad shops for the five railroads, horseshoe works, boiler and drill works, machine shops, stove works, sheet iron works, silk mills and large coal yards. Its prominent public buildings are its municipal buildings, several business edifices, the churches and schools. It has several private business schools, public and parish schools and a public library. The government is administered under a revised charter of 1875 and is vested in a commission of five, which holds office for a term of four years. Pop. (1920) 16,923.

PHILLPOTTS, fil'pôts, **Eden**, English novelist; b. Mount Aboo, India, 4 Nov. 1862. After serving as clerk in a fire insurance office at Plymouth in 1880-90, he studied in London for the stage, but found "his ability did not justify perseverance." His earlier works are of inferior value. Among his representative books are 'Down Dartmoor Way' (1895); 'Lying Prophets' (1897); 'Children of the Mist' (1898); 'Sons of the Morning' (1900); 'The Good Red Earth' (1901); 'The Striking Hours' (1901); 'The River' (1902); 'My Devon Year' (1903); 'The Secret Woman' (dramatized in 1912); 'Knock at a Venture' (1905); 'The Portreeve' (1906); 'The Virgin in Judgment' (1908); 'The Three Brothers' (1909); 'Dance of the Months' (1911); 'The Forest on the Hill' (1912); 'The Iscariot' (poem 1912); 'Widcombe Fair' (1913); 'Curtain Raisers' (1914); 'Old Delabole' (1915); 'The Human Boy and the War'

(1916); 'The Chronicles of Saint Tyd' (1917); and 'Storm in a Teacup' (1919). Phillpotts is the recognized interpreter of Dartmoor folk and scenery, and received high praise from R. D. Blackmore (q.v.).

PHILO BYBLIUS, fī'lō bib'li-ūs, **Heren-nius**, Phœnician grammarian; b. Byblos, Phœnicia; flourished between 64 and 141 A.D. He is the author of a famous historical work, 'Concerning Cities and Their Renowned Citizens.' It is in 30 books and has proved the thesaurus of later grammarians. He also executed a translation of the alleged work of Sanchuniathon (q.v.), of which some fragments have survived and have been published in the third volume of Müller's 'Fragmenta Historicorum Græcorum,' Vol. III. The alleged complete text of Sanchuniathon, which was discovered in a Portuguese monastery and published by Wagenfeld (1837), proved to be a forgery.

PHILO JUDÆUS, joo-dē'ūs, Jewish philosopher; b. about 20 B.C.; d. not later than 54 A.D. He went to Rome in 42 A.D. as one of a deputation from Alexandria to the Emperor Caligula, to persuade him to release the Jews from the obligation of adorning the imperial statue. He was the oldest of five deputies. This and the fact that he visited Jerusalem and belonged to a wealthy family is nearly all that is known of his life.

Before the time of Philo the Hellenized Jews (see **HELLENISTS**), particularly those of Alexandria, had begun to blend the ideas of the Greek philosophers with the teaching of their own sacred books; but as they generally held that the Pentateuch itself was the source of inspiration from which the Greeks derived what was true in their philosophy, they endeavored by allegorical interpretations of their own books to find "indications of the profoundest doctrines of philosophy in the simplest stories of the Pentateuch." It was in this school that Philo was brought up. His philosophy was thus strictly a theosophy. It rested, as its direct foundation, on the Jewish Scriptures as an inspired revelation, and with these it incorporated the speculations of the writer, founded on the systems of Greek philosophy, which best harmonized with the teaching of the Hebrew Scriptures, and especially on the philosophy of Plato.

Philo's idea of God was partly religious, partly philosophical. From his faith as a Jew he derived the principle that God is to be worshipped as a personal being, but in developing his conception of God he is indebted chiefly to philosophical speculations. He held that God is incorporeal and only cognizable by reason. He is the most universal of beings, and higher than knowledge, goodness or beauty, *per se*. He has, strictly speaking, no attributes, being pure, unqualified being; he is therefore incomprehensible. The attributes ascribed to God in Scripture are to be understood only figuratively. God is present everywhere in the material universe by his operations; nowhere in his essence. God is the only free being. All others are subject to necessity. Philo's notions of matter are not remarkably consistent. He held God to be too perfect to have any association with it, yet he holds Him to be the Creator of the uni-

verse. Between God and the world there is an intermediate being, the Logos. He wavers in his account of the Logos also. The Logos is the most universal of all beings except God. The Logos contains in itself the sum of ideas — powers or spiritual forms which pervade the universe, and which are creative, governing, foreseeing, law-giving, etc. These forms are also regarded as either qualities of the deity or distinct persons. Sophia, wisdom, is sometimes considered as the first of the potencies of the Logos, sometimes as the mother of the Logos. God created the world as already indicated, by the agencies of these potencies, or of the Logos in whom they reside, out of unqualified matter. He gives the Logos the titles of Son of God, Paraclete, and Mediator between God and Man.

Man is a dual being, having a soul that came from God, tied to a body that naturally tends to the things of sense; by the aid of God the soul may be lifted above the body and ultimately regain its original source.

In interpreting Scripture Philo recognizes a double sense, the allegorical, which is the more important, and the literal, which is not to be neglected. The anthropomorphic representations of God in Scripture he regarded as an accommodation to the sensual nature of man. It is a fundamental principle with him that the law, which emanates from the being who is both the creator and the father of the universe, is in harmony with nature, and that he who violates it is punished by natural events. Consult Drummond, 'Philo Judæus' (1888); Conybeare, 'Philo about the Contemplative Life' (1895); Freudenthal, 'Die Erkenntnislehre Philons von Alexandria' (1891), and the 'Jewish Encyclopedia.'

PHILOBIBLON, *fi-lō-bīb'lōn*, a prose eulogy of books and learning written in Latin by Richard Aungerville, called Richard de Bury from his birthplace (1287). He was bishop of Durham and lord high chancellor and treasurer under Edward III. The work was finished in 1300, and first printed at Cologne in 1472. 'Philobiblon' was intended to serve as a handbook to the library which he founded in connection with Durham College at Oxford (afterward suppressed). It gives an interesting account of how he collected his library, describes the state of learning in England and France and closes with an explanation of the rules for the management of his library, which were founded on those adopted for the library of the Sorbonne. An American edition was printed at Albany, N. Y. (1861), by Samuel Hand, and the Latin text, with translation by Andrew F. West, was issued by the Grolier Club of New York (1889). See AUNGERVILLE, RICHARD.

PHILOCHORUS, *fil-ōk'ō-rūs*, Greek historian: flourished in Athens between 306 B.C. and 260 B.C. Suidas states him to have been a contemporary of Eratosthenes, an adherent of Ptolemy Philadelphus, and a bitter opponent of Demetrius Poliorcetes and his son, the latter of whom had him put to death when he took possession of Athens. His best-known work, 'Atthis,' a history of Athens dating from the remotest period of their history down to the death of the author, is the most valuable and authentic of the special histories of Attica.

Fragments of it are preserved in Müller's 'Fragmenta Historicorum Græcorum' (1841).

PHILOCTETES, *fil-ōk-tē'tēz*, Greek archer. He was a friend and armor bearer of Heracles, who bequeathed to him his bow and arrows. As one of the suitors of Helen he started with seven ships for the Trojan War, but becoming ill from the bite of a serpent was left by the Greeks on the island of Lemnos. An oracle declared that Troy could not be taken without the arrows of Heracles, and Ulysses and Diomedes journeyed to Lemnos, whence Philoctetes accompanied them to Troy and fought bravely until the city was taken, slaying Paris with one of his poisoned arrows. The legend was dramatized by Sophocles, Æschylus and Euripides, the play by Sophocles still surviving.

PHILODEMUS, *fil-ō-dē'mūs*, Greek Epicurean philosopher and epigrammatic poet, a contemporary of Cicero. He was a resident of Gadara in Palestine, and a leading Epicurean of his time. The 'Greek Anthology' contains 34 of his epigrams.

PHILOLAUS, *fil-ō-lā'ūs*, Pythagorean philosopher; according to Plato he was a contemporary of Socrates, and was born in Magna Græcia. He left Metapontum on account of political disturbances and entered Lucania. Later on he visited Thebes. The teachings of Pythagoras were for the first time committed to writing by him. The only fragments of this work which are extant Böckh declares to be genuine (1819). Their genuineness has, however, been denied by Schaarschmidt, 'Die angebliche Schriftstellerei des Philolaus' (1864). Some of them are undoubtedly authentic, others spurious.

PHILOLOGICAL ASSOCIATION, American. See AMERICAN PHILOLOGICAL ASSOCIATION.

PHILOLOGICAL SOCIETY, British, a society founded in London, 1842, for the study of language according to its scientific analysis. It publishes annually its 'Transactions,' a volume of papers read at its meetings, which are held monthly from November to June. The most important work of the British Philological Society has been the publication of the 'New English Dictionary,' which was begun under the editorship of James (later Sir James) A. H. Murray in 1857, and has not yet been completed.

PHILOLOGY. See LANGUAGE, SCIENCE OF.

PHILOMEL, a poetic name for the nightingale (q.v.), especially the large Asiatic species (*Daulias philomela*) or the Persian form (*D. hafsi*).

PHILOMELA, *fil-ō-mē'la*, in Greek mythology, daughter of Pandion, king of Athens; was by fraud won by Tereus, a Thracian king, to be his bride, Tereus pretending that his wife, Procne, her sister, was dead. Lest Philomela should reveal her wrongs, Tereus cut out her tongue. But she contrived to acquaint Procne with her story. The sisters in revenge slew Itys, son of Tereus, and served him to his father at table. The gods transformed Philomela into a nightingale and Tereus and Procne, Itys and Pandion into other birds.

PHILOMELA, *The Lady Fitzwater's Nightingale*, title of a romance by Robert

Greene, published 1592, probably founded on the story of Tito and Gisippo in the Decameron, or the 'novela del curioso impertinente' related in Don Quixote, Book 1, chap. 34 et seq.

PHILOPÆMEN, fil-ō-pē'mēn, Greek general and statesman: b. Megalopolis, Greece, 252 B.C.; d. Messene, Greece, 183 B.C. He came of a noble Arcadian family, was orphaned at an early age and brought up by Cleander, an influential citizen of Mantinea, received his education under the philosophers Ecdemus and Demophanes, and gained his first military experience in the border raids between the Arcadians and Laconians. In 222 he aided in the defense of Megalopolis against Cleomenes, king of Sparta, and in 221, at the head of a company of horsemen, fought under the Macedonian king, Antigonus, who came to the aid of the Achæans against the Spartans. In 210 he was appointed general of the Achæan horse, and in 209 accompanied Philip in his expedition against Elis, conducted himself with his usual bravery and slew in battle the Elean commander Demophantus. In 208 he was elected strategus or commander-in-chief of the Achæan League, an office to which he was seven times re-elected. He introduced reforms in military arms and discipline, and brought the army to the highest state of efficiency it had attained since the decline of Greece. In 208 he utterly routed the Spartans under Machanidas at Mantinea and was proclaimed the "liberator of Greece" at the Nemean festival. In 194 he was reappointed strategus, defeated Nabis in 192, forced Sparta to enter the Achæan League and upon her revolt in 188 defeated her forces and compelled her to adopt Achæan laws. In 183, when Philopæmen lay ill at Argos, the Messenians revolted and he arose from his sick-bed to lead the army against them, though now a man of 70. He was captured and given a cup of poison by Deinocrates, the Messenian leader. He is the last of the great Greek commanders. Consult Plutarch, 'Life of Philopæmen'; Mahaffy, 'Alexander's Empire' (1888).

PHILOSOPHER OF FERNEY, *The*, a title by which Voltaire was known on account of his residence from 1758 to 1788 at Ferney, five miles northwest of Geneva.

PHILOSOPHER OF MALMESBURY, *The*, a title given to Thomas Hobbes (q.v.), who was born at Malmesbury in Wiltshire.

PHILOSOPHER OF SANS SOUCI, *The*, a name which Frederick the Great applied to himself on account of his residence at the palace of Sans Souci which he built at Potsdam.

PHILOSOPHER OF WIMBLEDON, *The*, a name bestowed upon John Horne Tooke (q.v.), the political writer and grammarian, whose later years were passed at Wimbledon, Surrey.

PHILOSOPHER'S STONE. See AL-CHEMY.

PHILOSOPHICAL SOCIETY, *American*. See AMERICAN PHILOSOPHICAL SOCIETY.

PHILOSOPHY. *Definition of Philosophy*.—No satisfactory answer to the question, What is philosophy? can be derived either from the meaning of the word, or from the consensus of opinion expressed by writers on

philosophy, unless these opinions are themselves subjected to comparison and criticism from the philosophic point of view. For the conception which defines the task, and describes the method of philosophy is itself subject to change and growth; and accurate and harmonious definitions are themselves among the latest products of any pursuit conducted by a truly scientific method. But this, like every other development, has certain permanent features; it follows, more or less closely, certain clearly discernible lines of movement. To describe these features and follow these lines must, therefore, determine the method of our attempt to answer the question: What is philosophy?

In its most general meaning, though in rather vague and aimless fashion, *philosophizing* dates back to the very beginnings of human mental development. The savage or primitive man (the *Naturmensch*), instead of being as is sometimes supposed, untroubled by metaphysics, is much more, if this were possible, naively and necessarily metaphysical than is his civilized descendant. But the results of his reflective thinking over the problems of existence, of the origins of things and of human life and destiny, take the forms of myth and legend rather than of scientific system.

The particular line of development which chiefly concerns us in the attempt to define philosophy is traced back to the Greeks. This statement is true for two reasons: (1) The Greeks first separated philosophical speculation from its dependent connection with religious myth and theological conceptions; and (2) they are, in fact, the ancestors of that branch of the universal family of philosophers to which we belong.

History of Opinion.—Originally, a loose and wide meaning was given to the term "philosopher" (*φιλόσοφος*). At first, it stood for any man who, whether by travel or reading or interest in art, had the spirit and acquisitions of intellectual culture. Solon was said to have "traveled through many lands philosophizing" (Herodotus i, 30); and Thucydides, in his funeral oration over Pericles, claims for all the Greeks that they love the beautiful with true simplicity, and "philosophize without effeminacy." The earliest more systematic attempts at philosophy among the Greeks displaced the theogonies of the poets, or their explanations of the universe as due to the actions of the gods, with cosmogonies, or speculations as to the origin of things and the causes of experience, by means of known physical elements or mental principles. As yet, however, there was no distinction between philosophy and the positive sciences; and, indeed, *science* did not exist in the modern acceptance of the term.

It is customary to say that Socrates was the first "to lead mankind from the study of the universe to the study of man"; but this is only relatively true. With Plato and Aristotle the more definite conception of the sphere of philosophy, and the use of the more scientific method for its pursuit, began—not only among the Greeks but among all mankind. In spite of those many and important differences, which the latter seems to have taken pains to exaggerate, these two great thinkers are in substantial agreement as to the essential nature of philosophy. With them both, the word does

not stand for any one particular science or even for the aggregate of all the sciences; on the contrary, philosophy is held by Plato and Aristotle to be the supreme and only true science, or knowledge of the universal and unchanging.

Plato taught that philosophy imparts to the mind something more than merely "correct opinion"; that it deals with being, and not with seeming; with the truly real; it, therefore, implies the acquisition of what is knowable, in the highest meaning of the word. But the essential and immutable being of everything is its idea; and of all the ideas, the supreme one is the idea of the good. Philosophy is, therefore, the knowledge of the ideal and absolute elements of things. Aristotle, on the other hand, regarded philosophy as science, or knowledge, in general; in his scheme it comprised the speculative, the practical and the artistic sciences. But there was also a "first philosophy," or supreme science; and in his conception of this, Aristotle agrees in the main with Plato. For "first philosophy" investigates being as being; it inquires into the first principles and ultimate causes of things; and thus it renders possible the knowledge of that absolute principle which presupposes nothing more ultimate than itself. The peculiar characteristics of philosophy are thus held to be its certainty, universality, independence, supremacy and a kind of divine character. This last characteristic makes it worthy of honor even by Deity itself.

Although the later Greek philosophy, under the conduct of the Stoics and the Epicureans, took a more practical turn, and although philosophy during the Middle Ages, being employed by Christian theologians in the defense of dogma, lost much of its characteristics of independence and supremacy, the conceptions of the greater Greek thinkers remained substantially unchanged down to modern times. When the Renaissance gave back to philosophy its independence, both Bacon and Descartes regarded philosophy as a universal science. The former held that all human cognitive endeavors are summed up in history, poetry and philosophy, which correspond to the three faculties of memory, imagination and reason. Thus everything which is an object of knowledge by human reason falls within the sphere of philosophy. Bacon, too, like Aristotle gave a special place to first philosophy. Descartes regarded philosophy as a universal science; but first philosophy is the science of principles,—that is, of the highest generalizations of all the positive sciences. Descartes did in a way for modern philosophy what Socrates is said to have done for Greek philosophy; he made its point of starting a critical examination of the mind of man.

With Locke and his successors, but especially with the critical philosophy of the "astounding Kant" (first edition of his 'Critique of Pure Reason,' 1781), philosophy became chiefly an analysis and criticism of the cognitive powers of the human mind. Thus one branch of the subject—namely, the philosophy of knowledge, or epistemology—occupies the chief place in, if it does not usurp the whole of, the field properly covered by the term. Such is in a peculiar way the position of Kant, who holds that the primary and chief task of philosophy is to ascertain the *a priori* elements and prin-

ciples of the human mind, and to arrange these together into a system. As to a science of reality—meaning by this, the knowledge of the world of beings that exist independently of human mental representations—this great thinker comes to a sceptical conclusion. But with the successors of Kant philosophy began again to be considered more as of old—an absolute, universal and independent science, whose authority within its own proper domain must be considered as supreme. In one way or another, this was the position of Fichte, Schelling and Hegel.

While the Scottish school, consisting of Reid and his followers, reduced philosophy to a kind of theoretical psychology, and Positivism denied the possibility of philosophy with anything like its traditional meaning and claims; still the conception of its aim and its scope, which is honored by time and is essentially the same as the ancient notion, continues to maintain itself. Yet there are to be noted significant changes in the points of view, in the use of method, in the factors chiefly emphasized; and, especially, in the notion of the relation which philosophy properly sustains to the particular sciences. These changes must, then, be briefly noticed, if one would arrive at a satisfactory answer to the question: What is philosophy?

Analysis of the Factors.—The modern conception of philosophy can now, in its more complete and scientific form, be best understood by stating what are the principal problems, or groups of problems, which it attempts to solve. These may be conveniently arranged under the following four heads: (1) Especially since the time of Kant, the question of the nature, limits and validity of human reason itself has occupied a prominent place in the discussions of philosophy. With Kant himself—as we have already seen—this self-criticism of reason was the principal part of philosophical discipline. To quote the words of Fichte: "This science can be nothing but the universal knowledge, which has come to know of itself, and has entered a state of light, consciousness and independence, in regard to itself." Or, according to the more extreme statement of another advocate of a similar view: "Philosophy calls itself knowledge of the Universe (*Weltweisheit*)"; but "we call it self-knowledge."

From this point of view, the outcome of philosophical discipline may be either one of two conclusions. The criticism of reason may end in what is known as positivism, or some form of phenomenalism. In this case reason, by self-criticism, would have discovered and proved that reason itself is limited to appearances of phenomena; that human knowledge cannot reach the world of reality. In a word, philosophy as a reasoned and systematic ontology, or a valid doctrine of real being, is found to be impossible.

But the opposite conclusion—namely, that all human knowledge somehow envisages, or implicates, reality—necessarily leads the thinker who holds it to lay emphasis on another main branch of philosophical discipline.

(2) The second form of the modern conception of philosophy continues to emphasize the factors rendered prominent by Plato and Aristotle, and which, indeed, have been prominent in the entire history of reflective thinking. As Matthew Arnold tersely puts the question:

"We want to know what Being is." And in its revolt from the self-criticism which ends in scepticism, the mind of man continues to inquire after the nature of ultimate reality; it continues to believe that the forms of man's own mental life of cognition do somehow faithfully and truly represent the beings and events of a world which lies outside of that mental life, and which has, so to say, an existence and a value of its own. Philosophy is then conceived of mainly as a growth of assured knowledge of reality, and as a speculative activity of the human reason toward the transcendent ground of all existence. This view of the task of philosophy is that of Hegel and of all his followers, however dissenting from the details of the Hegelian system. It is also the view of those who, like Schopenhauer and Hartmann, cultivate systematic philosophy as a so-called metaphysics of the unconscious. It is even substantially the view of Herbert Spencer who, in spite of his doctrine of the Unknowable, has built up upon the basis of facts supposed to accord with his peculiar view of evolution, one of the most complete and stupendous theories of reality which the history of speculative thinking has ever produced. In a word, according to this view, "philosophy is the rational science of reality." Or, as another modern writer declares: It is "the science of the most supreme and important realities."

(3) It has always been felt that the more speculative conception of philosophy leaves the problems of human life too much out of its account. In order to merit appreciation for its real value, reflective and speculative thinking ought to result in practical truths or conclusions which may serve to enrich and guide the moral and social interests of mankind. This conception of the philosopher's task has always been prominent in the Orient. And in Oriental countries to-day the true philosopher is he who has wisdom; and so can counsel men as to what they ought to do, and as to what, in the world of reality itself, ought to be. In modern times Kant himself wrote (preface to Jachmann's 'Examination of the Kantian Philosophy of Religion') that, while philosophy, as a scientific theory, has only a relative value, "philosophy, in the literal meaning of the word, as a doctrine of wisdom, has an absolute value; for it is the doctrine of the final purpose of human reason." From this point of view philosophy is chiefly a reasoned theory of values; and the principal task of the philosopher is to deal with the value-judgments of mankind, with the ideas and ideals of humanity as to what ought to be, — in conduct, in art, in society and in religion. In his effort to do this, the thinker must, of course, justify reason in respect of her ideals, and not simply discover and describe what those ideals happen to be at any particular point of time, or at any particular place, in man's historical development. It appears, therefore, that philosophic wisdom in this meaning of the term implies knowledge of the reasonable and of the universal.

(4) The great advances of the particular sciences in modern times have forced into a conspicuous position another and somewhat different conception of philosophy. This conception is by no means wholly new. For it has never been supposed that speculative thinking,

whether in the form of a self-criticism of reason, or of a reasoned theory of reality, or of a rational system of practical principles, could dispense with all knowledge of facts, their uniform sequences and the laws of the forces operative in their realization. But the modern scientific development has certainly made imperative a new adjustment of the relations between philosophy and the particular sciences. Each one of these sciences is fast discovering its relations of reciprocal dependence and mutual good-will toward all of the other sciences. Each one when pressed to give an account of itself is discovered to have its own body of uncriticised presuppositions, its own naive theory of knowledge and theory of reality, so to say. And, indeed, it is not difficult to show that even the most purely physical and positive of the sciences have to include certain value-judgments and conceptions of what ought to be in their methods of research and in their discovered principles. And thus the conception of philosophy as a "science of sciences" is, as it were, born anew, but with increased duties and increased liabilities to make mistakes, although also, with increased promises of success and reward. It is from this point of view that Professor Wundt has described philosophy as "the universal science which has to unite the cognitions, obtained by the particular sciences, into a consistent system."

Synthesis of the Factors.— Both a study of the history of philosophy and a reflective consideration of these four groups of problems lead to the same conclusion. No one of the four can be left out of the proper conception of the field of philosophy. In particular, the theory of knowledge and the theory of reality, the self-criticism of reason and the unceasing and undaunted endeavors of reason to reach a worthy knowledge of the world of reality, are like the two sides of the one shield; or rather, they are twin ways of the functioning of man's rational powers, neither of which can exist without the other and both of which are destined to live because belonging to the very life and growth of reason itself. Moreover, what man knows, or thinks he knows, about his own rational life and about the ultimate reality, can never fail to be regarded by him as a basis for conduct, for art and for religion. Man cannot manage his life wisely, without regard to his views upon so-called epistemological and ontological problems. His doing cannot be wholly divorced from his thinking. For as one of the great modern philosophers (Fichte) has said: "A philosophical system is not a dead bit of furniture which one can take to one's self or dispose of, at pleasure; but it is endowed with a soul by the soul of the man who has it." And they who have no metaphysical system are none the less, whether savage or civilized, naïvely metaphysical. Especially is it true that religion is always and essentially, not merely a matter of feeling and cult, but also a certain theory of reality.

Hence the effort arises to summarize these groups of factors and unite them in some one conception. This attempt leads us to the following preliminary definition of what modern philosophy is attempting to accomplish. Thus defined:—

Philosophy aims to establish, by the valid use of human reason, a harmonizing and unitary

view of the world and of human life, based upon the principles presupposed and ascertained by the particular sciences. More briefly said: philosophy is the attempt at a critical and rational system of man's judgments and beliefs that have reference to reality and to the ideals of ethics, art and religion.

Relations of Philosophy to the Particular Sciences.—The definition of philosophy suggests that its relations to the particular sciences may be considered from two somewhat diverse points of view; and when considered from these points of view, the relations themselves divide into two classes. For in the first place, philosophy is critical with respect to the presuppositions, or assumptions of each of the particular sciences; and it aims, by its criticism, to harmonize and unite the conclusions of all the sciences. Philosophy is, therefore, when regarded from this point of view, superior to the particular sciences; it is their critic, judge and arbiter, or referee, so to say. But, on the other hand, philosophy is dependent upon the particular sciences. It cannot, without committing itself to an absurd and irrational attempt and to a course of reasoning doomed to failure, refuse to take its points of starting, its material of facts, laws and subordinate principles, from these same sciences. For philosophy does not purpose to construct a world that shall accord with the fancy and sentiment, however animated and exalted, of the individual, speculative reason. It aims, the rather, to discover upon what universal or most general principles the world *is, in fact, constructed*.

With reference to the critical attitude of philosophy toward the particular sciences it is to be noted that all these sciences have their common presuppositions, or opinions and judgments taken for granted. It is not their business, as such, to discuss the nature, limits and validity of man's cognitive faculties, or the grounds upon which reposes his belief in his power to transcend the particular in his own experience and to know the extra-mentally real; or to settle other problems of a theory of knowledge. Moreover, each one of these sciences has its own convenient and appropriate assumptions. For example, the mathematical and physical sciences assume some sort of reality for space and time; they also assume that these forms of man's apprehension are valid for the actually existing physical bodies, molecules and atoms, for the luminiferous ether and for the emanations from radio-active substances, etc. Physics and chemistry also take it for granted that all these physical beings actually move, combine, separate and enter into an indefinite variety of actual relations to one another. They also assume that forces have some kind of real existence; that these forces are actually conserved and correlated; and that this takes place in some uniform and regular way; that is, they assume the existence and reign of so-called laws. The biological sciences make all these and still other assumptions; for, under any of the numerous current theories of evolution, they claim to be able mentally to represent the order and causal connection of organic forms with one another, the reactions upon the changes in their environment and the laws of their relations, as the actual history of real beings must have taken place, or probably did take place,

extending over wide areas of space, during enormous stretches of time.

And in a word: The claim to know what is real and true is an assumption of all the particular sciences. And since the claim is an assumption of all the particular sciences, philosophy, as a so-called epistemology or theory of knowledge, becomes in this way the critic of them all. Moreover, as metaphysics or theory of reality, it examines critically the real meaning and validity of these assumptions. Thus it inquires: What is the real nature of space; and what is it really to be in space? What is the real nature of time; and what is it really to exist, or to continue, in time, etc.? Again, all real beings—both things and minds—are regarded as occupying time; and things, at least, are said to occupy space. What, then, is it to occupy space and time; as the beings of the world of our experience must do, in order to be known as real? And still further: What sort of reality attaches itself to the conception of force (or its modern substitute in physics—namely, energy)? and—more puzzling question still: What takes place in actuality when force is said to be stored, or set free; or when the energy is called that of position or that of motion? Motion itself, when considered as really taking place and as anything more than a subjective change in relations of apparent position, offers many puzzling problems to our philosophical inquiries. But, perhaps, most complicated of all is the question: What is it to be a cause, to cause and to be caused, etc.?

Moreover, the particular sciences, in dependence on their assumptions, are constantly increasing and modifying the stock of their conclusions regarding the real nature of the beings of the world and regarding the actual character of the relations between these beings and of their transactions in the time of the world's history. All these principal conclusions are of interest to philosophy. It accepts them gratefully, so far as they may be regarded as proved or highly probable, from the hands of the workers in the particular sciences.

This need of the critical and harmonizing work of philosophy becomes the more clear when we consider another side of human experience with which another group of the particular sciences attempts to deal. This group of sciences is especially connected with that branch of philosophy which deals with the problems of human life. But the solution of these problems requires the consideration of certain facts of a quite different order from those with which the physico-chemical, or even the biological sciences, as such, are competent to deal. What are called value-judgments—or judgments which express not merely the mental apprehension of the truth of fact and law, but the mental appreciation of the worth of certain facts, ideas, emotions and ideals—offer many interesting problems for the student of human life. Most of these problems concern the genesis, development, grounds and ultimate nature, of what men believe and think "ought to be," rather than what they conjecture or know, "actually is." But several of the particular sciences attempt to deal with this same class of problems. These particular sciences, too, although they are generally, in themselves, more philosophical than are the physico-chemical sciences, have their own assumptions and arrive

at a more or less defensible system of conclusions respecting matters of fact. For the feelings and judgments and ideals of what ought to be are themselves facts of human experience.

Philosophy and science come into peculiarly intimate and important relations, when the phenomena of the religious consciousness and religious development of the race are subjected to study by the historical and psychological methods. Anthropology and comparative history are making it more and more evident that man is essentially a religious being; while psychology is just beginning to show how deeply seated in all his various conscious functions, as well as in what is figuratively called his subliminal self, is the religious experience of man. The three allied sciences of psychology, anthropology and comparative history are, therefore, all exceedingly busy just now in the collection and discussion of the data necessary to frame a so-called science of religion.

Numerous instances, to illustrate and enforce this function of philosophy in its relations to all the particular sciences, might be brought forward. But one or two are sufficient for the present purpose. The chemico-physical sciences, and the sciences of biology, psychology and anthropology, as influenced by the chemico-physical sciences, have been forming a more and more complete conception of man as, himself a piece of intricate mechanism, set in the totality of a vast natural system, a natural universe, mechanically conceived. Thus placed, the individual and the whole race are regarded as strictly determined in all their actions and development, after the analogy of a chemico-physical system or organism. But such a mechanical conception of human nature, of its functioning and its development, has never seemed satisfactory to morals, to art or to religion. Hence there has been and still is a contention between the two—"a long-standing and unsettled strife"—as to the right conception of man and of his place in the universe. Philosophy must mediate in this strife. It asks: What is it to be a cause; and are things and minds causally related in the same way? It aims to harmonize the demands of the physico-chemical sciences with the feelings, value-judgments and ideals, of the moral, æsthetical and religious consciousness of man.

Or again: the physico-chemical sciences think it right to insist upon such a conception of the Being of the World as shall represent it in terms of impersonal forces, and of a universal but unconscious and purposeless ordering of its own affairs. *It* (or Nature) behaves thus and so; and it develops as it does, in accordance with its own inherent forces and immutable laws. These sciences are naturally and properly shy of what they call anthropomorphism. They think that the Being of the World is not scientifically conceived of, when the conception is anthropomorphic. But morals, and art, and religion, are naturally and properly careful to conserve the interests of the feelings, judgments of worth and ideals, in which, so to say, their most valuable assets chiefly consist. They are, therefore, more indulgent to the imagination and intellect in their combined effort to construct a picture of the Being of the World, which shall not violate, but shall on the contrary satisfy, these ethical, æsthetical and religious interests. Such an effort is necessarily

anthropomorphic in a different way from that in which the chemico-physical sciences think it altogether safe to indulge themselves. Thus morals, art and religion make the Being of the World, good, and beautiful, and worshipful,—in brief, an ideal personal Being. That which the former sciences conceive of as an impersonal system of forces and laws the ideals of the mind prefer to conceive of as perfect ethical spirit, to be admired, worshipped and obeyed, as God. But philosophy must exercise, in a supremely important way, its harmonizing offices in the attempt at a solution of this great problem.

The number of subordinate problems, in the consideration of which the reconciling office of philosophy is helpful and indeed indispensable, is not small. But the end which philosophy diligently and unswervingly pursues has already been described; it is the forming of a harmonizing and unitary view of the world and of human life.

Philosophy and Psychology.—Among the particular sciences there is one which stands in a peculiarly intimate relation to every branch of philosophical discipline. This science is psychology. Indeed, so intimately related are psychology and philosophy that some writers have insisted upon the impossibility of distinguishing between the two. But this is an exaggeration of the real state of the case. The modern science of psychology aims to treat by scientific methods the phenomena of human consciousness in such manner as to form a valid conception of the nature, genesis and laws of the development of man's mental life. It, therefore, admits of many subordinate and yet cognate divisions. It concerns itself downward, so to say, with the psychical life of the lower animals, with the facts and laws of human physiology, and especially with the science of nervous phenomena; and outward and backward in history, with anthropological and antiquarian researches. In its method it does not neglect the study, from the psychological point of view, of the products of the human mind, in the other sciences, in literature, in art and in philosophy. It even regards history itself as man's will and intellect, written in the large. But psychology also leads onward and upward into philosophy, in a very imperative way.

The relations between psychology and philosophy are so intimate that, in many cases, the two have been—as has already been said—largely, or almost wholly, identified. This has especially been true of English philosophy. For example, Locke's 'Essay Concerning Human Understanding' has been called—although improperly—"the most important offspring of modern philosophy." But its author describes his purpose to be an inquiry "into the original, certainty, and extent of human knowledge, together with the grounds of belief, opinion, and assent." This inquiry necessarily raises problems which we should now say belong to psychology, and also to that branch of philosophy which is called epistemology; but it does not completely cover the field of either psychology or philosophy. A modern English writer (Ward) has maintained that we cannot define psychology at all, because we cannot distinguish, at the outset, "what takes place in the mind" from "what takes place without"; and a distinguished German psychologist (Wundt) affirms that the partition of sovereignty be-

tween psychology and philosophy is an abstract scheme which, in the presence of the real facts, always appears unsatisfactory.

The modern view, however, is distinctly favorable to separating, as far as possible, between the spheres of psychology and philosophy, and to treating psychology as one of the particular sciences. Thus understood, this science will collect, compare, analyze and discuss the phenomena of man's mental life, with a view to a tenable theory of the nature and development of the so-called human soul, or mind. Without doubt many of the particular problems of psychology may be and should be treated by the scientific method, and after making only such naïve assumptions as are necessary to all the positive sciences. On the other hand, it is apparent that the deeper probing of even those problems almost irresistibly leads to such discussions of the nature and authority of consciousness, and the nature and relation to the "outside" world, of the human mind, as demand the methods of reflective thinking, in a word, need philosophizing. For example, the problem of sense-perception, or our knowledge of things by the senses, is primarily a problem for psychology. But the study of sense-perception soon compels the recognition of a certain belief in the reality, both of the objects perceived and of the perceiving self, and in the actuality of relations of interaction between the two. From the beginning the different schools of philosophy have divided sharply over the nature, grounds and validity of this belief; and over the nature, grounds and validity of the distinctions implied, between the perceiving self and the object which is perceived.

In this connection it should also be said that psychology, like all the other particular sciences, has its own assumptions, or points of view and conception, which have not yet been

which its pursuit inevitably leads, it is itself dependent upon philosophy; and, finally, that philosophy is something much more than a higher stage of psychology; for philosophy aims at a rational system of the conceptions and principles, presupposed or ascertained by *all* the particular sciences.

Divisions of Philosophy.—Like every other vast field of human research, philosophy needs to have made some specific allotment of its different aspects, if not of its wholly separable portions. The problem of making this allotment is the problem of division. Its inquiry is: How many, and what, are the different main branches of the general subject? But like every other similar problem in scientific division, the realities to be considered do not follow any strictly logical order; nor do they observe definitely fixed bounds to their relations, in a way to favor only one method of division. For these reasons different writers on the subject have advocated different ways of dividing the general field of philosophy. Nor do we attach any super-eminent claims to excellence for the scheme of division we are about to propose.

In every attempt at systemizing the problems of philosophy, two considerations should be borne in mind: (1) These problems are all interdependently related to one another; and they all sustain the relations which have already been described, to certain of the particular sciences. But, at the same time, (2) these various problems require treatment in a manner to contribute toward the attainment of the final purpose of philosophy. This we have seen to be a reconciling and uniting view of nature and of human life.

The following table expresses, according to our views, the truth of philosophy in the division of its different chief problems:—

I. Philosophy of the Real [Metaphysics, in the wider meaning of the word]	1. Theory of Knowledge [Or Epistemology, Noëtics] 2. Theory of Reality [Ontology, or Metaphysics in the narrower meaning of the word]: with its two branches	A. Philosophy of Mind B. Philosophy of Nature (or of physics, etc.)
II. Philosophy of the Ideal [Or of that which ought to be: Idealology, or Rational Teleology]	1. Ethics, or the Ideal of Conduct [Metaphysics of Ethics, Moral Philosophy or Practical Philosophy] 2. Æsthetics, or the Ideal of Art [Philosophy of the Beautiful]	
III. Philosophy of the Absolute [or the Supreme Ideal-Real]	This endeavors so to conceive of the Being of the World, or the Ultimate Reality, as to unite the conclusions of the other branches of philosophy.	

critically examined. For example, the study of the science of psychology assumes that the mind is real, and that the things it perceives by the senses are real; that knowledge of the mind and of things is possible; and, also, that the common-sense conceptions of space, time, force, relation and all the other so-called categories are sufficiently accurate for beginning its scientific pursuits. But philosophy challenges and criticises all these assumptions.

It would appear reasonable, then, to respect this intimate and necessary relation between psychology and philosophy, in the following way. The former, when pursued as a science, should be allowed the same rights in making its preliminary assumptions, and in arriving at its conclusions, as those which belong to all the particular sciences. But psychology should, as far as possible, recognize the fact that in the more speculative solution of the problems to

Different Main Branches of Philosophy.—

It now remains only to describe, in the briefest manner possible, the different groups of problems which correspond to the divisions of philosophy indicated in the table given above. Among these we have to notice:—

The Theory of Knowledge or Epistemology.—In the second edition of his 'Critique of Pure Reason' Kant affirms that "philosophy requires a science to determine *a priori* the possibility, the principles, and the extent of all cognitions." Modifying this statement somewhat, we may say that epistemology investigates the universal and permanent factors of our experience in a way to answer these three questions: (1) What really is knowledge? (2) What are the limits of human knowledge? and (3) What is the nature and guaranty of the certainty of knowledge? The position of philosophy toward all these questions is that of criti-

cal inquiry. In taking this position the mind makes the effort to strip itself of all prejudices and even of all presuppositions; and, by a process of patient and thorough reflective thinking, to probe to the bottom its own cognitive powers. Thus we have before us the somewhat strange and intensely interesting spectacle of the knowing mind striving to know itself as knower:—to understand its own doubts and beliefs, the principles upon which its life of knowledge bases its existence and growth, and the nature and direction of the barriers to its knowing powers which are set by its own constitution, or by the fixed relations in which its activities stand to its own objects.

The limits of this article do not permit that we should discuss at length the problems themselves and the answers arrived at by the different schools of philosophy, in this branch of its manifold investigations. It must suffice to say that the one most important point of difference concerns the relation in which those mental states which we call cognitive—or states of knowledge—stand to extramental realities. Upon this point we find the extreme so-called idealistic school, or school of phenomenalism, holding that, for every individual mind, only its own states can be known; or, in a word, all knowledge is of phenomena; and all known phenomena must be subjective, or modifications of consciousness that can be relied on only to tell the truth about themselves. On the other hand we find those who claim that knowledge is, always and essentially, some sort of an envisagement, or immediate apprehension, of reality; and that this claim is as true for things as for our own selves. Between these two views on the epistemological problem lie many others of a mediating sort.

Theory of Reality, or Ontology.—This same branch of philosophy is also properly called metaphysics, in the narrower meaning of the word. In its most general form its attention is directed upon the problem, What is reality? More elaborately expressed we may say that metaphysics is the critical and systematic exposition of those necessary conceptions and presuppositions which enter into man's cognition of what he considers to be real. Popularly said, this branch of philosophy strives to answer the question: What is it to be real?

Now even a superficial and preliminary examination is enough to show that there are certain conceptions which the mind, always and of the strictest necessity, applies to every kind of a real object. Such conceptions have been called "categories." For this reason, a doctrine of ontology has sometimes, not inaptly, been spoken of as a criticism of the categories,—meaning, by this word, the conceptions which are always and necessarily applied to all beings considered to be real, and to all events considered to be actual (as distinguished from non-existent or imaginary).

But there are two different classes of real beings—namely, minds or selves, and things or non-self-like existences. And these two do not really exist under precisely the same conditions, or display precisely the same essential qualities, or enter into precisely the same relations, whether among themselves or between each other. Things and Minds are, then, essentially unlike in respect of some qualities which they must have, respectively, in order to

exist at all. Moreover, the kind of energy which things and minds display, and the actual dynamical relations into which they can enter with other beings, are markedly different. General metaphysical philosophy is divided, then, into the Philosophy of Mind and the Philosophy of Nature.

The Philosophy of Mind.—The primary object of this branch of philosophy is to determine what claim to reality, and to a place in the system of real things, can be established for the Ego, or subject of mental states. The skeptical and phenomenalistic view regards the mind as merely a succession of states. The now old-fashioned theory of mental substance regarded man's soul as some sort of an entity that might be conceived of as existing in reality, without, however, doing anything or showing its peculiar forms of active life in any way. The modern theory of the nature of mind is more dynamical, as it were. It finds the essential core of the being of mind in activity; and it tries to determine the nature of this being by studying the mental life as a development of more and more complex combinations of permanent forms of activity. This form of examination it applies to the critical inquiry after an answer to such problems as follows: What is it really to be as all minds are? What is the character of that unity which belongs to the mind?—at least, in its normal and developed condition, however such unitary being may be disturbed by double (or triple) consciousness, and other similar phenomena. Thus the inquiries of this branch of philosophy have a very important bearing on the questions which religion raises with regard to the nature, origin and probable destiny of the human soul, and of the race.

The Philosophy of Nature.—It is not sufficiently recognized that a very large proportion of the entire body of the modern natural and physical sciences is really metaphysical, in the strictest meaning of the latter term. Moreover, the metaphysics of the chemico-physical and biological sciences is of the most subtle, elaborate and difficult character. No one can doubt this who has attempted even partially to understand the modern conceptions of atoms, electricity, ether, physical energy, the constitution of matter and the nature of the relations sustained to one another by different material existences. And, indeed, the new discoveries as to the existence and behavior of radio-active substances, and their emanations, of germ-cells and their developments, are complicating enormously the metaphysics of these sciences. The truth is that the metaphysics of things (or the philosophy of nature) is much more obscure, complex and at present purely tentative, than is the metaphysics of mind. On the other hand, the amount of patient research and the order of talent given to this branch of philosophy at present are such as to encourage the most hopeful attitude toward its future developments. What are the essential qualities, what the universal and permanent relations, what the laws and final purposes, of material things, are philosophical questions which physics, chemistry and biology are now investigating in a most productive manner.

Ethics, as the Philosophy of Conduct.—The opinions of men as to the right and wrong of conduct may profitably be studied from the historical point of view. A study, by the meth-

ods of psychology, of the nature of man as fitted for conduct and for the development of moral character, furnishes further material for an attempt at a science of ethics. But all such empirical methods of examining the problems of morality only raise, but do not solve, the more ultimate and profoundly interesting problems. Among these are such as the following: What is the essential nature of the morally right? What is the authority and guaranty of the feeling of obligation to do the right? (As Kant would propose the question: How can there be a categorical imperative?) But, finally, what ground, that is universal and unchanging, can be found for the morally right, in the real being of the world? Such questions as these define the sphere of the metaphysics of ethics.

Closely akin to these are the questions propounded to aesthetics.

Æsthetics, as the Philosophy of the Beautiful.—Here again the historical study of art and of the development of opinion and feeling respecting beautiful objects, as well as the analysis of so-called æsthetical consciousness, only raises, but does not answer, the questions of chief interest to philosophy. Such study shows that man has always regarded the characteristics of beauty as not merely subjective, but as really belonging to the object. The beautiful is distinguished from the sensuously agreeable by the possession of two characteristics in a special way: these are objective validity and ideal worth. Hence the inquiry arises for a ground of that which seems to human consciousness to be possessed of these characteristics; and that ground philosophy aims to place in the Being of the World. But this is equivalent to regarding this being as an ideal life, conceived of after the analogy of the human spirit. It is this feeling of kinship for the beautiful in nature, of which even the rudest and most savage of mankind show manifest signs, that led the poet (Byron) to exclaim:

"Are not the mountains, waves, and skies a part
Of me and of my soul, as I of them?"

It is obvious, however, that such personifying of that system of things which science calls nature, must provoke much skeptical criticism; whether the personifying take the form of constructing this system in terms of the ideal of ethics or of the ideal of æsthetics. In this way the mind is challenged and directed in its renewed effort to perform the supreme task of systematic philosophy.

The Philosophy of the Absolute (or Supreme Ideal-Real).—All the other branches, therefore, lead up toward and are auxiliary to the philosophy of the absolute. In this way the reflective thinking of humanity makes its constantly renewed and developing, but never completely satisfying and final, effort at a supreme synthesis. It attempts to reach such a conception of the Being of the World, or the universe considered as the manifestation of an essential unity, as shall accord with the facts and laws of the particular sciences, both physical and psychological, and at the same time harmonize their differences and seeming contradictions. In this attempt metaphysics comes into closest relations with the so-called philosophy of religion.

Besides the phenomena of man's ethical and

artistic life and development, we have to notice those of his religious life and development. The conception of the Being of the World to which the highest religious development of humanity has attained is that of a perfect ethical spirit, into moral and spiritual relations with whom man may come by voluntary acts of communion and service. Philosophy, therefore, has before it the final problem of striving to satisfy all the various demands of man's many-sided nature and development in the conception which it presents of the Ultimate Reality, or the World-Ground. The appropriate name which philosophy bestows upon its conception of this unitary being is the Absolute. [It should be borne in mind, however, that such terms as "absolute," "infinite," "unconditioned," etc., can never be employed in a quite unlimited way. Thus "absolute" means freed from conditions of dependence, not from all conditions whatever; "infinite" means, without certain kinds of limitation, not wholly indeterminate, a merely negative conception, etc.].

The most profound and important questions debated by the different schools of philosophy, from the beginning of its existence in any systematic form up to the present time have, therefore, concerned the nature of, and relation of mankind to, this so-called Absolute. But the differences of opinion existing between these different schools may be best summarized by saying that they concern the character and the amount of personality which may properly be attributed to "the Absolute." On this point we find one extreme claiming that the two conceptions—namely, of absoluteness and personality—are not only incompatible, but antagonistic. On the other hand, the conclusions of psychology, philosophy of mind, epistemology, and even a theory of reality based upon the conceptions of science, are being summoned to show that all human thinking and living is conditioned upon the essential personality of the Absolute, or likeness of the environing world to the human self. And perhaps it is no exaggeration to say that some such form of an ideal-realism is just now the kind of philosophy which divides the field of reflective thinking with those who still cling to the skeptical position of phenomenalism.

The Benefits of Philosophy.—It is customary to bring the ceaseless discussion of the ultimate problems of philosophy, and the alleged fruitlessness of this discussion, as a serious and even conclusive charge against the usefulness of philosophy. To answer this charge fully it would be necessary to pass in review the entire history of man's development in reflective thinking. This history would show conclusively that every great movement in science, art, morals, religion, and even in politics and social affairs, has been profoundly influenced by the pre-existing and current philosophical opinions. And if this influence has ever been injurious to, or restrictive of, human welfare, its only counter-acting influence has arisen out of the same source,—namely, the renewed and better use of human reason in the discovery of the complete and final truth touching the nature of reality.

But it is not true that the discussion of philosophical problems has been fruitless or, on the whole, harmful to the best interests of mankind. On the contrary, it may be successfully maintained that no other form of man's higher

life has made more essential progress, or has contributed more to other forms of progress, than has philosophy;—when the term is understood in the broad and generous way in which we have tried to interpret it. For in philosophy, man's reason reaches its supreme expression of the striving after what is ideally best; and this is to know one's self and one's fellows, the world and God, in a more profound manner, and so as to satisfy the entire intellectual, ethical, æsthetic and religious needs of the soul.

It will appear that our effort has been, not to advocate any special system of philosophy, but, the rather, to describe what philosophy in its modern form essentially is; what method it employs for the solution of its problem; and what are the principal problems which give occasion for division into the main types of philosophy. Even this limited discussion of the subjects, however, suggests certain considerations which concern every man's choice of position toward philosophy in general and toward its contending systems. We mention some of the more important of these considerations:

1. The method of all philosophy is essentially rationalistic. To philosophize is to use the reason, or the reflective powers of the human mind, in the search for an answer to the profounder problems of existence and of human life. Criticism, and even scepticism of the most unlimited kind, have no other method that is tolerable to the most shallow conception of what philosophy is, than the rationalistic. In this meaning of the word, all philosophical opinion is some form of Rationalism.

2. Philosophical criticism, like every other use of the critical faculties, implies an indestructible faith in the authority and validity of reason. The very last and most impossible thing for a mind endowed only with powers of sensation and animal intellect to accomplish, or even to undertake, would be the task of self-criticism. From this it follows that a complete and unlimited scepticism is suicidal. Especially in the form called solipsism, or skeptical idealism, is this statement manifestly true. You cannot argue that only knowledge of the self by the self is possible, without implying the existence of other selves, known by the self that argues to be really existent and actually in the exercise of essentially the same rational faculties.

3. It follows further that all philosophy is necessarily to some extent realistic, is indeed some form of Realism. To begin the process of reflective thinking with the denial of all cognition of actual facts and real existences is to attempt the impossible. All thinking, and especially all philosophizing, assumes some ground of standing in actual happenings and real existences. Something is real. But what is real; and what is it to be real?

4. But especially true is it that every system of philosophy is, essentially considered, some of Idealism. The existence and potent influence of human ideals are as obvious and determining of opinion, in the most rigidly mechanical doctrines of the human soul and of the universe of things, as they are in the wildest flights of Plato's imagination in the *Timæus*, or in the most mystical of the writings of Brahmanism or Buddhism. The question remains for philosophy ever anew to strive the better and the more fully to answer: What are the ideals

actually followed in the constitution and on-goings of the world of things, and in the constitution and development of the human soul?

5. Philosophy, like all the other endeavors of the human mind, and like the particular sciences and special forms of social union undertaken by the race, is under the laws that control all human development. These laws are involved in immensely complicated phenomena, and as yet are far from being brought within the grasp of the human understanding. But the facts suffice to warrant the affirmation that philosophy, like all other forms of human development, is essentially teleological. It is aimed toward some far-distant goal, in the supreme excellence of which the ethical, æsthetic and religious ideals of reason encourage and support an undying confidence.

Bibliography.—For the detailed opinions of the writers on the problems of philosophy, besides the *Introduction to Philosophy*, the following treatises may be consulted: *Philosophy of Mind*; *A Theory of Reality*; *Philosophy of Knowledge*; *Philosophy of Conduct*; *Philosophy of Religion* (2 vols.). The following list is chosen from books most accessible and most likely to be profitable for the average reader:

GENERAL PHILOSOPHY.—Külpe, *Introduction to Philosophy*; Robertson, *Elements of General Philosophy*; Watson, *An Outline of Philosophy*; Russell, B., *The Problems of Philosophy*; Russell, J. E., *First Course in Philosophy*; Sidgwick, H., *Philosophy, its Scope and Relations*; Höffding, H., *The Problems of Philosophy*; Bergson *Creative Evolution*.

THEORY OF KNOWLEDGE.—Hobhouse, *The Theory of Knowledge*; Ormond, *Foundations of Knowledge*; Enriques, *Problems of Science*; James, W., *Pragmatism* and *The Meaning of Truth*; Pearson, K., *Grammar of Science*; Bergson *Introduction to Metaphysics*.

METAPHYSICS.—Bradley, *Appearance and Reality*; Mackenzie, *Outlines of Metaphysics*; Bosanquet, *Nature and Value of Individuality*; Royce, *The World and the Individual*; Taylor, A. E., *Elements of Metaphysics*.

PHILOSOPHY OF MIND AND MATTER.—Holman, *Matter, Energy, Force and Work*; Mach, E., *Analysis of Sensations*; Stallo, *The Concepts and Theories of Modern Physics*; Ward, *Naturalism and Agnosticism*.

ETHICS.—Seth, *A Study of Ethical Principles*; Paulsen, *A System of Ethics*; Sidgwick, *Methods of Ethics*; Wundt, *Ethics*; Moore, G. E., *Ethics*; Dewey and Tufts, *Ethics*; Palmer, G. H., *The Nature of Goodness*; Royce, *The Philosophy of Loyalty*; Mezes, *Ethics, Descriptive and Explanatory*; Aristotle, *Nicomachean Ethics* (trans. by Peters).

ÆSTHETICS.—Marshall, *Pain, Pleasure and Æsthetics*; Santayana, *Sense of Beauty*; Puffer, *The Psychology of Beauty*; Begg, *The Development of Taste*; Broze, B., *Æsthetics*; Davies, *Art in Education and Life*.

PHILOSOPHY OF RELIGION.—James, W., *Varieties of Religious Experience*; Bowne, *Philosophy of Theism*; Pfeleiderer, *Philoso-*

phy and Development of Religion'; Tiele, 'Elements of the Science of Religion'; Balfour, 'The Foundations of Belief' and 'Theism and Humanism'; Ward, 'Pluralism and Theism'; Caird, Ed., 'The Evolution of Religion'; Fairbairn, 'Philosophy of Christian Religion'; Hocking, W. E., 'The Meaning of God in Human Experience'; Höfding, H., 'The Philosophy of Religion'; Pringle-Patterson, 'The Idea of God in the Light of Recent Philosophy.'

GEORGE TRUMBULL LADD,

Emeritus Professor of Moral Philosophy and Metaphysics, Yale University.

PHILOSOPHY, History of. The history of philosophy has a peculiarly close and vital relation to philosophy itself. It may even be said to form an essential and integral part of philosophical discipline. While a knowledge of the history of every science is of great service in aiding one to comprehend its standpoint and fundamental hypotheses, insight into the genesis and historical development of philosophical problems and conceptions is in philosophy a primary and essential requirement. For, in the first place, these conceptions are not the work of any single mind, or the possession of any particular school. They are the outcome of a long line of development to which many ages have contributed, and in which many individuals have borne a part. Even where different systems seem to be directly opposed as they successively make their appearance in history, the new is never a mere denial or displacement of the old, but is connected with it by positive lines of relation. And ultimately nothing which is of value is ever lost, but is taken up and preserved in the later systems. In short, the history of philosophy presents an account of the evolution of human thinking in one of its most universal aspects. It deals with the development of the process in which the race has attempted to express in scientific form its views regarding the nature of the world and its interpretation of life. These are problems to which the human mind must in every age seek to find an answer. The form of these inquiries, however, can never remain unchanged. For the object that every philosophical thinker seeks to understand is the world as it is known to him and to his generation. As new material is brought to light by the advances of the special sciences, or as the changing interests of practical life bring now this and now that aspect of reality into prominence, and thus leading to a modification of the standards of value, the problems of philosophy get new formulations, and the old systems show their inadequacy and need of revision. We may, therefore, say that the history of philosophy gives an account of the process in which the human spirit becomes constantly more clearly and definitely conscious of itself and its relation to the world. The task of philosophy, which accordingly consists in defining more clearly at once the nature of the self and of the world, must be undertaken anew by the thinkers of each generation. No age can rest in the definitions of the past. But, on the other hand, it is only in the light of the past that the thinkers of any particular age can understand their own problems. It is only by building upon the foundations already laid, by continuing the work of their predecessors, that they are able to accomplish anything of value. A philosopher's best originality

consists in developing, and thus rendering more exact and definite, the thoughts of those who have gone before him. It is true that he must work in the light of the science and practical insight of his day; but, in order to produce valuable results, it is necessary that his reason should be illumined by the philosophical conceptions and principles which have proved their fruitfulness in the great systems of the past.

There is, of course, a fundamental difference between this conception of the history of philosophy and that formerly prevailing which looked on it as a record of the opinions of individual thinkers whose theories had no positive or essential relation to one another. From this standpoint, the history of philosophy possesses merely an antiquarian interest. It leads us through a road strewn with the wreckage of discarded theories and broken-down systems. Oftentimes the diversity of opinion which it presents is taken as a proof that the goal which philosophy seeks to reach is unattainable, and its problems insoluble. In spite of the prevalence of the notion of development, this view of the history of philosophy still persists in some quarters. The conception of the history of philosophy as a process of development was, however, clearly formulated by Hegel (q.v.) a century ago. This conception gave a new significance to the historical facts and aided in arousing a new interest in their investigation. By Hegel himself, however, the development was conceived in a wholly logical sense. That is, he conceived the progress from age to age as determined wholly by the inner necessity with which inconsistent and inadequate thoughts lead on in a regular and absolutely necessary order to their own refutation and correction. As a result of this logical interpretation, Hegel was led to force the facts of the history of philosophy into an artificial scheme of thesis, antithesis and synthesis, corresponding to the universal thought movement as laid down in his 'Logic.' Moreover, in the light of this logical interpretation, the history of philosophy appears as an impersonal process of development characterized by inner necessity, where the individual thinkers seem to determine nothing through their free personality, but merely to represent a certain inevitable stage in the evolution of the thought of the race. In spite, therefore, of the great service which it has rendered, Hegel's conception has serious defects. For while fully admitting the importance of the logical factor, it is impossible to forget that the development of philosophy is the work of individual thinkers, whose conceptions spring from their own personal life, and that its progress is also modified by the general culture and prevalent interests of the times in which it makes its appearance. In investigating the history of philosophy, then, these various factors must be given due place. The task which investigation in this field has to perform has been stated under the following three headings by Windelband ('History of Philosophy,' § 2, 6): (1) 'To establish with precision what may be derived from the available sources as to the circumstances in life, the mental development, and the doctrines of individual philosophers; (2) from these facts to reconstruct the genetic process in such a way that in the case of every philosopher we may understand how his doctrines depend in part

upon those of his predecessors, in part upon the general ideas of his time, and in part upon his own nature and the course of his education; (3) from the consideration of the whole to estimate what value for the total result of the history of philosophy belongs to the theories thus established and explained with respect to their origin."

Philosophy, so far at least as it forms a part of the culture of the Western nations, took its rise in Greece in the 6th century B.C., and was developed by the independent thinking of the people of the Western world. Whether there existed anything that may properly be called philosophy among any of the Oriental peoples, particularly among those of India and China, or whether the so-called Oriental philosophy does not rather belong to the history of religion, are questions that may here be left undecided. Philosophy, as it is known to the Western world, may conveniently be divided into an ancient, a mediæval and a modern period. Ancient philosophy is almost entirely the product of Greek thought, and was first developed in the Greek colonies of Asia Minor in the East, and in Sicily and Italy in the West. It reached its culmination in Athens, and was finally cultivated at Alexandria, and at various points throughout the Greco-Roman world. Greek philosophy falls naturally into the pre-Socratic period, the Socratic School, including Socrates, Plato and Aristotle (q.v.) and the post-Aristotelian Systems. In this classification the Sophists may perhaps be regarded as a transition link between the first and second periods. Pre-Socratic philosophy was occupied mainly with attempts to explain the nature of the external world and the character of those physical phenomena that most readily attracted attention. According to the generally received account, philosophy had its origin in the 6th century with Thales of Miletus, in Asia Minor, who was followed in the same city by Anaximander and Anaximenes. We say that philosophy, which in its beginnings included all the sciences, had its origin with these men, because, so far as we know, they were the first to advance beyond mythologies, and definitely to raise and seek to answer the problem regarding the natural causes and principles of the world. A little later Pythagoras (q.v.) and his school, who flourished in lower Italy, did good service in developing the mathematical sciences, and also proposed a universal explanation of things couched in terms of numbers. Lower Italy was also the home of the Eleatics, whose greatest representative, Parmenides, taught the unchanging and unitary character of that which truly is. About the same time Heraclitus was maintaining at Ephesus, in Asia Minor, that everything is in process of change and becoming, and that nowhere is there to be found any permanent static being. To reconcile the opposition between the views of Parmenides and Heraclitus, both of which seemed to be justified by experience, later thinkers, Empedocles, Anaxagoras and the Atomists, while differing in important respects from each other, agreed in adopting a plurality of fixed, unchanging elements which are constantly forming new combinations by their union and being dissolved in turn. Thus while elements remain unchanged, what we call things are in constant process of transition.

The work of the Sophists was almost entirely critical and destructive. They are significant, however, as first calling attention to the subjective side of experience. This took the form of an assertion that knowledge exists only as sensations and feelings in individual minds, and that, therefore, there is no standard beyond the individual of truth or of moral values. The Sophistic skepticism was met and refuted by Socrates and his pupil Plato (q.v.), who showed, by a more thoroughgoing analysis of the nature of conscious experience, that in reason, as opposed to sense-perception, man possesses a standard both of theoretical and of practical truth. Aristotle organized the special sciences on the basis provided by his predecessors, and defined their field of inquiry, while at the same time applying and making more concrete in the field of philosophy the idealistic principles of Plato. During the post-Aristotelian period, the philosophical interest was mainly ethical and practical. The reasons for this are to be found in the political conditions of the time. The Greek states had lost their independence, and when the social and political institutions, which embodied the laws of life and conduct for the Greek in objective form, had thus collapsed, it became necessary for the individual to seek to find in his own nature the principles of practical guidance that life demands. At the same time, theoretical problems were not entirely abandoned, though in general they were subordinated to practice. Both the Stoics and Epicureans made philosophy include logic and physics as well as ethics, but both alike regard the two former disciplines merely as means, and the last alone as the true end. These two schools were founded at Athens at very nearly the same time (about 300 B.C.), the former by Zeno (q.v.), and the latter by Epicurus (q.v.). The Stoics taught a system of materialistic pantheism, which they drew largely from Heraclitus. In ethics, where their teachings are of the greatest importance, they emphasize the necessity of self-restraint and of independence of external goods and outward circumstances. They maintained that the highest good consisted in the attainment of virtue, and that this was entirely different in character from personal happiness or satisfaction. The school of Epicurus, on the other hand, based their account of the physical world upon Atomism, and in ethics they regard the rational pursuit of pleasure as the end of life. Skepticism made its appearance in Greek philosophy with Pyrrho (q.v.) (360-270 B.C.), in the school of the Academy with Arcesilaus about the time of Alexander the Great, and among a group of later thinkers in the 3d century of the Christian era. We find the skeptical arguments and difficulties which are familiar in modern times elaborated in great detail and urged with remarkable acuteness by these writers, particularly by Sextus Empiricus. Eclecticism (q.v.) flourished especially at Alexandria, where Philo (q.v.) sought to unite Hebrew theology and Greek philosophy, and among the Romans, where writers like Cicero (q.v.) selected freely whatever doctrines commended themselves in the various systems of Greek thought. Greek philosophy ends in Neo-Platonism (q.v.), which is a species of mystical theosophy. It abandons the attempt to discover ultimate truth by means of logical thought, and seeks to comprehend all

things in their immediate relation to God by inducing, from time to time, a state of ecstasy in which the limitations of ordinary consciousness are transcended, and the highest truths are apprehended in direct intuitive vision.

The ideas and conceptions introduced by Christianity gave a new impulse and direction to philosophical inquiry during the Middle Ages. During this period there was developed the consciousness of a fundamental opposition between God and the world, and in general between the spiritual and the natural. This shows itself in sharp division between Church and State, this life and the future life, priests and laity, etc. Along with this, there went also a sense of man's natural helplessness and lack of freedom, and the futility of all his attempts to save himself without divine grace. Mediæval philosophy may be divided into two main periods, a Patristic and a Scholastic period. These may be described in the words of Ueberweg: "In the patristic period, philosophic thought stands in the closest relation with theological speculation, and co-operates in the development of Christian dogma. In the scholastic period, it passes into the service of theology, being employed merely to reduce to scientific form a body of dogmatic teaching for the most part already at hand, by introducing a logical arrangement, and bringing to its support philosophical doctrines from ante-Christian antiquity." The work of the Fathers of the Church reached its culmination in Saint Augustine (q.v.) (354-430 A.D.), who, after his conversion to Christianity, employed his profound philosophical genius in explaining and justifying the theological dogmas of the trinity, of predestination and of the origin and nature of the human soul, etc. Scholasticism (q.v.), as Hegel has remarked, is modern science in embryo. It is the form under which the thought of the Western nations was molded and schooled for long centuries. Ostensibly, at least, philosophy during this period was entirely subordinated to the accepted theological doctrines. *Credo ut intelligam* was its professed motto. This subordination, however, was never absolute, and in every generation there were thinkers who modified, and to a greater or less extent rationalized, the teachings of the Church. In spite of the subjection of thought to authority, the history of the whole period shows a gradual though slow awakening on the part of European peoples to the rights of reason, a growing consciousness that thinking, to exist at all, must be free and independent. Early scholastic philosophy was mainly under the influence of Plato and the Neo-Platonic writers. Of Aristotle only the logical writings in the Latin translation of Boethius (q.v.) were known. The most noted names of this period are John Scotus Erigena, Anselm of Canterbury and Abelard (qq.v.). About the beginning of the 13th century, the Catholic scholars became acquainted, through the Arabians, with the other writings of Aristotle; and the great Dominican teacher, Albert Magnus (q.v.), was quick to see how the system of the "heathen" philosopher might be made the support and bulwark of the Church. This led to a revival and transformation of scholasticism. The doctrines of the Church found a new and broader philosophical basis in the profound system of Albert's pupil, Thomas Aquinas (q.v.) (1225-74), which was, however, sharply opposed on some points by

the subtle dialectician, John Duns Scotus (q.v.). During the 11th century, and during the first part of the 12th, and again in the last period of scholasticism, philosophical discussion centred round the question of the universal and its relation to the particular object. Realism (q.v.) maintained that the universal is the primary and fundamental reality in which and through which alone particular objects can exist (*universalia ante rem*). Nominalism, on the other hand, contended that the universal was nothing more than a name given to a number of particular objects, and that, therefore, only these have any real existence. It is at once evident that this controversy is only a particular form of the most fundamental problem of all philosophy, the relation of the one and the many. It is also interesting to note that the reappearance of nominalism in the later scholastic period was coincident with, and indeed an expression of the same spirit as, the new interest in natural science and in the observation and study of particular objects by empirical methods.

At the time of the Renaissance (q.v.), philosophy felt the same quickening influence which manifested itself in other fields. This renewed interest was first directed toward a study of other ancient systems besides that of Aristotle, who, as the official philosopher of scholasticism, was in many quarters condemned and decried. Plato and the Neo-Platonists were especially prized, and a Platonic Academy was founded at Florence by Cosmo de' Medici. This revival of the ancient learning was quickly followed by independent investigations in the field of physical phenomena, and to some extent also in that of the phenomena of mind. Here belong the names of Nicolaus Cusanus, Copernicus, Kepler, and, though later, that of Galileo (qq.v.). The results gained by the new science were combined into a monistic and pantheistic view of the world in the philosophical system of Giordano Bruno (q.v.). One of the most important steps taken by these early investigators of nature was the development of the concept of mechanical explanation, and the formulation of its principles in the laws of motion. Descartes (q.v.) applied the conception of mechanism to all the phenomena of the physical universe, reducing them to terms of motion and extension. Descartes was no materialist, however, but maintained the existence of spiritual substances, operating according to their own laws, alongside, and largely independent of, the world of physical bodies. Thomas Hobbes (q.v.), whose theories in ethical and political philosophy are of great historical importance, was the first thinker to be led by the principles of modern science to reduce all classes of phenomena, physical and mental alike, to mechanical terms.

One of the most striking characteristics of early modern thought is found in its consciousness of new problems, and in the resulting sense of a complete break with the past. It was felt that up to this time little or nothing had been discovered, with the exception of mathematics, which could pass as real knowledge. The first demand was for a right method of discovering truth. It was confidently assumed that when this fundamental need was supplied, diligence and co-operation on the part of scientific workers would in a short time reveal all of the important laws of nature. The

search for a method of scientific procedure gave rise to Rationalism and Empiricism (qq.v.), the two distinctive philosophical schools in the 17th and 18th centuries. *Rationalism endeavors to imitate the procedure of mathematics, which it regarded as furnishing the one species of certain knowledge. It seeks to start, as mathematics does, with a number of axiomatic principles; and by analyzing these, and showing the necessary results to which they lead, it will exhibit its conclusions as a system of demonstrable truth. In this theory of knowledge, observation of particular facts is not emphasized: the organ of knowledge is reason, which proceeds by the road of analysis and deduction. This method, first formulated and employed by Descartes, was most consistently applied by Spinoza (q.v.), and continued with some modifications and additions in the systems of Leibnitz and Wolff (qq.v.). The empirical method, with its inductive procedure, was emphasized and stated in eloquent terms by Francis Bacon (q.v.) in his 'Novum Organum.' Locke's 'Essay Concerning Human Understanding,' however, must be regarded as the starting point of philosophical empiricism. For it refutes in detail the doctrine of innate ideas, and maintains, as its fundamental thesis, that all knowledge is derived from experience, and that experience is given as definite and particular contents which are known to the mind through external sense-perception or through internal observation. Thus the starting point and the essential character of knowledge are found in particular facts passively perceived by the mind, while the activities of mind and the processes and principles of reasoning are proportionately minimized and given a subordinate place. In the development of this doctrine, Bishop Berkeley (q.v.) transformed Locke's "plain historical account" of mind into a system of empirical idealism. A little later, David Hume (q.v.), developing the empirical principles with the consistency and thoroughness of genius, arrived at utter theoretical skepticism regarding any rational basis of experience. Empiricism was also adopted and developed in France, notably by Condillac and Helvétius (qq.v.), but soon passed into naturalism and materialism, which finds its most pronounced expression in von Holbach's 'System of Nature.' Although usually taking an agnostic position on ultimate philosophical questions, empiricism has continued to have its representatives, among whom we may mention the names of David Hartley, Joseph Priestly, James Mill and his son, John Stuart Mill, and Alexander Bain (qq.v.). These writers have dealt mainly, though not exclusively, with psychology, where they have emphasized various forms of the principle of association as a connecting law of mental phenomena.

The skeptical conclusions of Hume were opposed in the name of Common Sense by Thomas Reid (q.v.), the founder of the Scottish school, and by his followers, of whom the most noted are Dugald Stewart (q.v.) and Sir William Hamilton (q.v.) in Scotland, and in America, President James McCosh of Princeton, and President Noah Porter (q.v.) of Yale University. Reid's method, which was somewhat refined and developed by his later followers, consisted in an appeal to the common sense of the plain man in order to estab-

lish the existence of certain fundamental principles that were perceived intuitively and immediately both in the realm of theoretical and of practical experience. This method serves to emphasize the fact that there is much in experience which is overlooked by the empirical account; but it was necessary that philosophy should define and exhibit this by a more systematic and scientific method of analysis. This Kant accomplished mainly in his epoch-making work, the 'Kritik of Pure Reason.' Kant showed that experience was not constituted simply by a given content, but that, in order that it should exist, there was also necessary a system of interpretative forms or functions on the part of the mind, and that these find their unity and complete expression in the nature of self-consciousness. He thus at once reconciled and completed the partial views of Empiricism and Rationalism, and, at the same time, furnished philosophy with a new principle and a new method. Nevertheless, Kant himself failed to perceive the full scope of his own principles, and maintained that knowledge can only deal with phenomena or appearances, while the world of things in themselves remains beyond the reach of man's knowing faculties. In the 'Kritik of Practical Reason,' however, he showed that it is admissible and necessary in the light of our moral experience to make certain postulates regarding the nature of the ultimate realities, though these postulates never attain the rank of knowledge, but must always remain matters of faith. In the 'Kritik of Judgment,' Kant attempted to unite the standpoints of the other two critiques, but the result, though very suggestive and historically important, was left in a somewhat indefinite and unsatisfactory state. Kant's philosophy was at once taken up and made the starting point of a notable line of development by three great thinkers, Fichte, Schelling and Hegel (qq.v.). These men all abandoned the absolute distinction between phenomena and things in themselves, and proceeded boldly in somewhat different ways to construct systems of Idealism (q.v.). To describe these briefly, we may say that Fichte's system is Ethical Idealism, finding in the moral life the ultimate explanation and *raison d'être* of the world; that Schelling's main interest is in external nature, which he interprets in terms of Evolutionary Idealism; while Hegel's system is more universal in its scope, and attempts to embrace in a vast logical scheme the complete process of the Absolute Thought, including all the facts of man's life in their historical evolution, as well as the laws and forms of the physical universe. Hegel's philosophy of nature cannot be regarded as successful; and his system contains formal paradoxes and artificialities that have prevented its real value from being generally appreciated. But, with all its defects, it can scarcely be doubted that it furnishes the most complete and satisfactory synthesis of experience that has yet been formulated, and that the progress of modern thought is constantly developing and rendering more concrete its principles. It was Hegel's great achievement to grasp clearly for the first time the conception of history as a rational organic process, and thus to rise to the notion of a dynamic and concrete universal. His ideas have, therefore, proved exceedingly fruitful in the development of social and political philosophy, as well as

in the more usual fields of metaphysical speculation.

In Hegel's postulate that the real is the rational and must disclose its nature to thought, we have the culmination of Rationalism. Schopenhauer, on the other hand, maintains in his 'The World as Will and Idea' the doctrine of Irrationalism,—that the world in all its various parts is not the expression of reason at all, but is the manifestation of a blind, purposeless principle, which he calls Will (q.v.). This insistence on Will as opposed to Reason (q.v.) does not, however, result in emphasizing more strongly the ethical life, as with Fichte. For Schopenhauer, Will is a blind impulse which manifests itself in the processes of nature which are usually regarded as purely physical, as well as in the phenomena of life and mind, while its coming to consciousness in man must be regarded as an unessential moment in its nature, and a misfortune. Its very nature is blind, purposeless striving that must forever remain unsatisfied. This is the basis of the Pessimism which Schopenhauer (q.v.) so convincingly enforces. Edward von Hartmann (q.v.), who makes the unconscious the ultimate principle of the universe, and whose system also results in Pessimism (q.v.), may be regarded as a follower of Schopenhauer, though he introduced certain modifications into the latter's system that seem to be derived from Hegel.

In opposition to Idealism, Johann Friedrich Herbart (q.v.) (1776–1841) developed the realistic elements in Kant's philosophy, and advanced a system which he called Realism (q.v.). He maintains the existence of independent beings beyond experience, existing in the form of simple quality-less "reals." By discarding the reference of mental phenomena to separate faculties and substituting for this formal explanation a statement of their concrete laws and relations, Herbart also contributed largely to the development of psychology as a science. R. H. Lotze (1817–81) shows in some points the influence of Herbart, but criticises keenly the latter's conception of simple independent "reals," and arrives himself at the notion of reality as a system of souls that are united organically with one another and with the life of the Absolute, while each still retains, in some way, and to some extent, its own independence and freedom. Lotze may thus be described as an ideal realist; or, since he finds the ultimate purpose and explanation of things in the idea of the Good, his system may be described as Ethical or Teleological Idealism.

An important philosophical movement called Positivism (q.v.), which still exerts an important influence in France, was inaugurated by Auguste Comte (1798–1857). By Positivism Comte means a mode of explaining phenomena which rejects all reference to the will of the gods or other superior beings (Theology), or to abstract essences or powers (Metaphysics), and deals solely with the invariable laws of the phenomena themselves. The order of the development of the human mind, and hence of all the sciences, is from the theological, through the metaphysical to the positive point of view. To render sociology, which has been the last in order of development, a positive science was the main object of Comte's writings. Positive philosophy is not a separate discipline, but the

synthesis and systematic co-ordination of all the sciences. Since the publication of Darwin's 'Origin of Species' (1859), philosophy, like all other branches of inquiry, has been especially influenced by the concept of evolution, and this notion has affected, to a greater or less extent, both the method and the conclusions of all recent writers. The only comprehensive "system," however, that has yet appeared, based professedly on this conception, is that of Herbert Spencer (q.v.). In the 'Synthetic Philosophy' Spencer has furnished an account in evolutionary terms of the origin of the physical universe from a primitive nebula, and has also traced the genesis of animal life, and the human mind, as well as the evolution of conduct, and of social life and institutions. He thus aims to give in his philosophy a complete synthesis of the sciences. The question may, however, be raised whether Spencer's adoption of the standpoint and conception of the particular sciences, and especially of the physical sciences, as final, without criticism or modification, does not render his conclusions unsatisfactory as the last word of philosophy.

Professor of Logic and Metaphysics, Cornell University.

PHILOSOPHY, Moral. See **ETHICS**.

PHILOSTRATUS, fī-lōs'tra-tūs, **Flavius**, ('The Elder'), Greek Sophist and rhetorician: b. Lemnos about the middle of the 2d century A.D. Few facts regarding his life have come down to us. We know that he taught rhetoric at Athens and subsequently at Rome, where he obtained the favor of the Emperor Septimius Severus, and was received into the circle of literati that the Empress Julia Domina had gathered around her. His principal work is his 'Life of Apollonius of Tyana,' which is regarded as rather fiction than history. His other works include the 'Heroicus,' dealing with the Trojan War; the 'Eikones,' a description of certain paintings the author says he had seen at Naples; 'Vitæ Sophistarum,' or the lives of several of the Sophists; and 'Letters.'

PHILOXENIAN (fī-lōk-sē'nī-an) **VERSION OF THE BIBLE**, a translation of the Greek version of the Hebrew Scriptures and of the New Testament books into Syriac, made by Philoxenus (or Asenaya), bishop of Mabogh, early in the 6th century for the use of his coreligionists of the Monophysite or Jacobite sect or branch of the Syrian Church, the Peshitto version, already in existence, being deemed unfaithful. Philoxenus' version was highly esteemed by his contemporaries: he was one of the most eminent writers of Syriac; but his version of the Bible was superseded by two others, and only fragments of it are extant.

PHILOXENUS, fī-lōk'sē-nūs, Greek dithyrambic poet: b. 435 B.C.; d. 380 B.C. He was originally from Cythera, and upon the capture of the island was taken as a prisoner of war to Athens, where he became the slave of Melanippides, the musician, who educated and freed him. For a considerable time he lived at the court of Dionysius I of Syracuse. He severely wounded the vanity of the tyrant by refusing to praise the latter's verses, declaring, on being given one to revise, that the best revision would be to draw a black line through the entire production. As a result he was put in prison; he either escaped thence or soon after his release left the court. He wrote 24 dithyrambs, including the 'Cyclops,' his most celebrated work, and the 'Deipnon' ('Banquet'), of each of which fragments remain. He was long highly esteemed; and so late as the time of Polybius his dithyrambs were annually presented by the Arcadians.

PHILTRE, fīl'tēr, in popular superstition, a love powder or love potion. From the earliest times it has been supposed that there were means by which love could not only be excited but be directed to a particular object. Various substances from the animal and vegetable kingdoms have been used for this purpose, some disgusting, some injurious, some without any distinguishing character. The truth is, that physical desire may be produced by physical stimuli, which are called *aphrodisiacs*, but it is absurd to suppose that such means can produce a passion for a particular object.

PHINEAS FINN, *The Irish Member*, a novel by Anthony Trollope, published in 1869. Taking its title from the name of its hero it is the earliest of Trollope's political novels and was followed by 'Phineas Redux' (1873); 'The Prime Minister' (1875) and 'The Duke's Children' (1886). In accordance with Trollope's custom of linking one fiction to another by presenting some of the same characters in each, Phineas and many of the *dramatis personæ* of 'Phineas Finn' appear in the later novels of the series.

PHINEUS, fīn'ē-ūs or fī'nūs, king of Salmydessus, Thrace, son of Agenor. He was a blind soothsayer and had received his prophetic powers from Apollo. Different traditions prevail concerning the cause of his blindness, but the one generally accepted is that it was a punishment inflicted upon him for his cruelty to the children of his first wife whom his second wife hated. He was tormented by harpies, who seized his food or rendered it unfit for use and was freed from them by Zetes and Calais, in gratitude for which service Phineus fitted out the Argonaut expedition.

PHINTIAS, fīn'tī-ās. See **DAMON AND PHINTIAS**.

PHIPPS, Henry, American manufacturer: b. Philadelphia, Pa., 27 Sept. 1839. He was engaged in various business houses of Pittsburgh, Pa., until 1861, when he became a member of the firm of Bidwell and Phipps, dealing in powder. Later he engaged in the steel industry in which he amassed an immense fortune. He is actively interested in various educational and philanthropic enterprises, has presented to the public several fine conservatories, established a completely equipped botanical garden in Schenley Park, Pittsburgh, in 1900, and in 1903 founded and endowed the Henry Phipps Institute (q.v.) at Philadelphia for the treatment of tuberculosis. He also built a psychiatric clinic in connection with Johns Hopkins Hospital, Baltimore.

PHIPPS INSTITUTE, *The Henry*, an institution in Philadelphia, Pa., founded by the generosity of Henry Phipps (q.v.) of Pittsburgh, Pa., for "the study, treatment and prevention of tuberculosis." The institution was opened 1 Feb. 1903 and incorporated under the laws of the State of Pennsylvania, 1 Sept. 1903. The first medical director was Lawrence F. Flick. The first year there were in the house 52 beds, which were occupied all the time, and 2,000 patients were treated in the dispensary. Inspectors visited the homes of the outside patients to see that instructions were carried out. In 1903 the institute gave a series of international lectures which were

largely attended. Great opportunities are furnished by the institute for research into the nature and best treatment of tuberculosis.

PHIPS, or **PHIPPS**, **SIR William**, American colonial governor: b. Pemaquid (now Bristol), Me., 2 Feb. 1651; d. London, England, 18 Feb. 1695. His youth was spent as a shepherd and as an apprentice to a ship-carpenter, after which he went to Boston, learned to read and write and then engaged as a trader. He married a rich Boston widow, built for himself a ship and engaged in commerce. Fired with the hope of regaining the treasure from a Spanish ship wrecked off the Bahamas, he went to England and prevailed upon the British Admiralty to furnish him a ship and means to seek the treasure. The expedition was unsuccessful but a second venture in 1667, backed by the Duke of Albemarle, resulted in the recovery of treasure to the value of £300,000, of which Phips' share was £16,000; he was also knighted and made sheriff of New England. In 1690 he commanded a fleet of eight vessels in an expedition against Port Royal which he captured, and later in the same year commanded an expedition against Quebec with a fleet of 34 vessels, but was unsuccessful and on the return voyage nine of his vessels were wrecked. He visited England endeavoring to induce the government to send another expedition against Quebec and while there, through the influence of Increase Mather (q.v.), was appointed first royal governor of Massachusetts. His first official act was the organization of a special court which speedily terminated the prosecutions for witchcraft. While governor he was accused of arbitrary measures and conduct, and in 1694 was summoned to London to answer complaints made against him. He received promises of restoration, but died in London before they could be carried out. Consult Cotton Mather's *'Magnalia'* (1702); Francis Bowen's *'Life of Sir William Phips'*, Vol. VII; Sparks' *'American Biography'* (1834-37); Myrand, *'Sir William Phips devant Quebec'* (1893).

PHIZ. See **BROWNE**, **HALBOT KNIGHT**.

PHLEBITIS, inflammation of the veins. It may begin outside of the vein, from some wound, abscess, etc., from which irritant material travels upward in the loose connective tissue of the vein-bed. The inflammatory process invades the coats of the vessel, disturbing their nutrition and reaching the inner coat, where it causes cloudy swelling and roughness of the surface, on which the blood tends to coagulate in layers, and thus may form a clot large enough to block the vessel. Or the inflammation may begin from within the vessel, owing to a clot forming on its inner wall, and which, acting as an irritant, excites inflammation in the coats of the vessel from within outward. In the first case the formation of matter is likely to occur around the vessel, and parts of the clot, which is soft and loose, are apt to become detached and to be carried by the circulation to other parts, setting up similar changes there. In the second case the vessel is likely to be obliterated and converted into a fibrous cord. Death may result where a large vein is obstructed. The disease is indicated by great tenderness, tension, acute pain and a knotted, cord-like swelling in the course

of a vein or veins, sometimes attended with discoloration of the surface. Dropsical swelling of the affected part or of a whole limb may occur.

Phlebitis may be prevented by proper care in the dressing of wounds, so as to keep the wound clean and healthy. The treatment is various. The patient must be kept perfectly quiet; the part be elevated; nourishing food should be given; tonics are of great advantage; stimulants are often required; and antiphlogistics locally applied will allay the inflammation. Abscesses within reach should be opened. Ligation of the part and washing out are also resorted to with success. See **PHLEGMASIA**.

PHLEBOLITE, a calcareous concretion formed within a vein. Such formations are due to the degeneration of coagulations in veins, or occasionally may have their origin in the coats of the vessels. Phlebolites which have formed nodules vary in size from that of a pinhead to that of a pea. They are also called vein-stones.

PHLEBOTOMY. See **VENESECTION**.

PHLEGETHON, flĕj'ĕ-thŏn, in Greek mythology, a name given to a river of fire in the infernal regions. See **COCYTUS**.

PHLEGMASIA, a painful inflammation attended with considerable swelling, especially affecting the cellular tissue, such as phlegmasia glandulosa and phlegmasia myoica. Phlegmasia dolens (Phlegmasia alba dolens, white-leg milk-leg), the principal form, may affect both sexes. It has appeared in convalescence from typhoid fever and dysentery; in diseases of the rectum; as the result of the removal of fibroids and of the ovaries; but for the most part it is a disease of the puerperal state. It usually occurs in the left leg but both legs may be affected. As a disease of the puerperal state it is seldom seen nowadays, but when it so occurs it usually appears the second or third week after parturition. Premonitory symptoms are frequently absent, but there may be feverishness for a day or two. Pain, swelling and tenderness appear in the upper part of the thigh and extend downward and in 24 hours the whole leg may be swollen and hard and more or less tender, but not reddened. The leg is pale or sallow, has a glossy or polished appearance and is sometimes called marble-leg. Usually in a few days the pain and swelling diminish, but it is often several weeks before the disease disappears and sometimes the condition lasts indefinitely. After its disappearance persistent aching of the limb, œdema of the foot, muscular weakness, etc., may remain for a long time. The causes of phlegmasia dolens are periphlebitis, phlebitis and thrombosis. It commonly results from an extension through lymphatic vessels of inflammation from and about the uterus to the tissues surrounding the great vessels of the thigh. The origin of the primary inflammation is not always ascertained, but it most frequently results from uterine infection (puerperal or contact infection) by pathogenic germs introduced by infected hands, instruments, etc., into the uterus. The treatment is both constitutional and local—sleep and rest in recumbent posture with the limb in a comfortable position and elevated; tonics and laxatives if necessary; easily digested food; hot anodyne fomentations; and when the disease disappears, careful bandaging, fric-

tion and favidization. A common complication is pulmonary embolism, in which case death supervenes in almost all cases.

PHLEGRÆAN (flēg-rē'ān) **PLAIN**, a volcanic plain on the Campanian coast west of Naples, Italy. Legendary lore locates this plain as the scene of the combat between the gods and the giants. Ruins of numerous Roman buildings are found here.

PHLEGYAS, flēj'i-as, in Greek mythology, king of the Lapithæ; he was son of Ares (Mars) and father of Ixion and Coronis; he is commemorated in the Hymni Homericæ.

PHLEUM, a genus of grasses including timothy grass. See GRASSES IN THE UNITED STATES.

PHLOGISTON, flō-jis'tōn, in chemistry, a hypothetical substance supposed at one time to be a part of all bodies that were capable of being burned. The conceptions of the terms element and combustion have been many and varied, but the first of real importance to the phlogiston theory was that of Becker (1635-82). He held that all inorganic substances were composed of three "earths," the mercurial, the vitreous and the combustible called "terra pinguis," and that when substances were burned or metals calcined (oxidized) this latter "earth" escaped. Stahl (1660-1734) expanded this idea into what was known as the Phlogiston Theory. This holds that all substances capable of burning—and calcination was recognized as slow combustion—contained a substance called phlogiston and that this was given off when the substance burned. A substance that burned readily contained a large amount of phlogiston; and as coal did so with the evolution of a large amount of heat and left little residue, it was supposed to be nearly pure phlogiston. A substance that had been burned could be rephlogisticated and thereby made capable of being burned again by being heated with a substance rich in phlogiston. Thus the result of the burning or calcination of a metal, known as a metallic calc, could be changed back to the metal by being heated with coal. This theory was generally accepted by chemists until toward the end of the 18th century. Phlogiston itself was never isolated, though the hydrogen discovered by Cavendish was thought by some to be this all-important substance. Facts began to accumulate, however, that seemed opposed to this theory. It was shown that metals gained instead of lost weight when calcined. Phlogisticians at first denied this, but later tried to explain it by claiming that phlogiston possessed negative weight, and that, therefore, a substance would, of course, be heavier when it had been driven off. Substances would not burn except in the presence of air. This was said to be because the air must be present to take up the phlogiston. The final overthrow of the theory was accomplished by Lavoisier. He showed and proved by careful weighings that a metal when calcined gained in weight and exactly as much as was taken from the air. Later, after the discovery of oxygen and its presence in the air by Scheele and Priestley, he showed that it was this oxygen that combined with a burning substance. Combustion was thus shown to be combination with oxygen rather than loss of phlogiston, and the phlogiston theory was

abandoned. See COMBUSTION; LAVOISIER; PRIESTLEY; STAHL.

PHLOX, a genus of herbs of the family *Polemoniaceæ*. The species, of which about 30 have been described, are mostly tall, spreading perennials, and with two exceptions, a Siberian and a Chilean species, are all natives of North America, where they are extensively distributed. Their showy flowers, borne either in terminal clusters or solitary, and their ready adaptability to a wide range of soils and situations, have made phloxes general favorites in gardens. They are hardy and very floriferous and have developed a large number of hybrids and cross-varieties of great diversity of form, colors and markings. They are of two classes: the annuals, all the garden varieties of which have been derived from *P. drummondii*, a Texan species; and the perennials, derived from several species, some of which are still cultivated in the pure natural form in old gardens. Of these last one of the best known is the moss or ground pink (*P. subulata*), which is a favorite plant in rockeries and cemeteries, since it does well in dry soils and forms a dense mat of foliage and bloom. The cultivated perennial phloxes are, however, mostly derived from *P. maculata* and *P. paniculata*. The annual varieties are readily grown from seeds planted under glass or in the open air in spring, the seedlings being transplanted to good garden soil as soon as the weather becomes favorable. The perennial varieties may be propagated by seeds, but since these do not produce progeny like the parent, cuttings of stems or roots and division of the clumps are generally preferred. Division may be made in early spring or in autumn; stem-cuttings during the summer and root-cuttings in spring or fall. After they commence to grow, cutting plants are managed like seedlings. In the garden, the perennial sorts are planted three or four feet apart and divided every two or three years; the annuals are set a foot apart.

PHOBOS (Greek, "fear," an attendant upon the god Mars), in astronomy, the inner satellite of the planet Mars. It was discovered at Washington, in 1877, by Asaph Hall. It is remarkable for its small size and for the rapidity with which it revolves about its primary. Its diameter is only about six miles, and its period of revolution is 7 hours, 39 minutes and 14 seconds. See DEIMOS.

PHOCA PHOCIDÆ, the genus and family of the typical seals. See SEALS.

PHOCÆA, fō-sē'ā, ancient Ionian city in Asia Minor, situated on a peninsula between the gulfs of Elæa and Smyrna and on a neighboring island. Legend makes it a colony of Athens. It early attained great commercial importance, indeed the earliest Greek coins seem to be those of this city. Clay wares were its main export. Among its western colonies was Massilia, now Marseilles, and as early as the 6th century B.C. tribute was paid the city by native chiefs of southern Spain. But in 540 B.C., after a heroic defense the city was captured by Cyrus' lieutenant Harpagus; many of the inhabitants migrated to Corsica, where they successfully met the attacks of Carthaginians and Etruscans, and then to southern Italy, where they founded the city of Velia. A few of the Phocæans had rebuilt the city in the meantime; and in the Ro-

man period it again grew to prominence and wealth. It was sacked by the Romans during the war with Antiochus; was attacked without success by Aristicus of Pergamus; and then sank again into obscurity. The Genoese founded the city of New Phocæa near the site of the old in 1421.

PHOCAS, fō'kas, Byzantine emperor: b. Asia Minor; d. Constantinople, October 610. He was of low birth and served in the army of Mauritius as an obscure centurion, where he gained a name for brutal courage among his fellows. In 602 he headed a revolt against Mauritius, seized the throne and after his coronation executed Mauritius and his five sons. Later accusing the Empress Constantina of conspiracy against him, she with her three daughters was cruelly put to death by his orders. He secured peace with Europe, but Chosroes II of Persia waged a determined war against him; and in 610 Heraclius, son of the exarch of Africa, led an expedition against him, invested Constantinople and put the tyrant to death with cruelty equal to that exercised by Phocas in his sanguinary reign.

PHOCAS, Column of, a monument in the Forum at Rome erected in 608 in honor of Phocas, emperor of the East. The column, 54 feet high, is of such artistic excellence that it is presumed that its workmanship must have been long before the 7th century. It was rediscovered in 1813.

PHOCION, fō'shī-ōn, Athenian general: b. about 402 B.C.; d. Athens, 317 B.C. Of humble descent, he was educated under Plato and Xenocrates, receiving instruction which influenced his entire life. His first military service was performed under Chabrias, where he rendered good service in the victory at Naxos in 376 B.C. In 349 he was sent with troops to Eubœa, where he defeated the forces of Philip of Macedon, banished Plutarchus from Eretria and secured the island against the invasion of Philip. Later he defeated Philip's forces at Megara, re-established the walls of Nicæa, and on a subsequent expedition to Eubœa freed Orcus and Eretria from the Macedonian rule. In 340 he was sent to the Propontis, where he forced Philip to abandon the siege of Byzantium and Prienthus. As leader of the peace party at Athens he advised the surrender of Demosthenes and other orators demanded by Alexander after the destruction of Thebes in 335, but upon the refusal of the demand headed the second embassy and succeeded in appeasing Alexander. After the death of Alexander in 323 Phocion reluctantly assumed command of the forces which were to free Athens from the Macedonian sway. They were at first successful, but ultimately were compelled to make peace. Upon Antipater's death Phocion became involved in an intrigue with Cassander, rival of Polysperchon, and was compelled to flee to Phocis, whence he was delivered up to Polysperchon by the Athenians and by him forced to drink poison. The Athenians later repented of their injustice and buried Phocion with high honors. Consult Plutarch, 'Life of Phocion.'

PHOCIS, fō'sis, an ancient division of central Greece and since 1899 a nome in the present kingdom. It lay to the north of the Gulf of Corinth; was largely taken up by the range of Parnassus, so that there were only a few fertile

spots along the river valleys, especially the Cephissus, where excellent wines were grown; and gained most of its importance from the sacred city of Delphi (q.v.). The antiquity of settlements in Phocia is attested by the mention of the district and its most important cities in the Homeric catalogue of the ships in the second book of the Iliad. Myth makes the Leleges, Hyanthians and Thracians the first settlers, but the people in historic times were clearly of Dorian stock. The history of Phocis is little more than a series of quarrels over the oracle and treasure house at Delphi, of which the confederation of the 22 Phocian cities claimed to be guardian—a claim supported by Athens, always opposed by the Thebans and with less animus by the Thessalians (who were severely defeated at Hyampolis at the beginning of the 5th century B.C.), as well as the Spartans, against whom the Dorian Phocians joined Athens in the Peloponnesian War. The first Sacred War, 595–585 B.C., resulted in the destruction of Cirrha, a city which had lived by plundering pilgrims to Delphi. In the second Sacred War Phocis gained control of Delphi in spite of Sparta's intervention, but lost it again 30 years after by the terms of the Truce of Nicias (421). The third Sacred War began with a decree of the Amphictyonic Council of 357 B.C., no doubt dominated by Theban influence, condemning the Phocians to pay a heavy fine for having used part of the sacred lands of Delphi; and this decree was finally carried out in spite of the resistance of the Phocians, who were long secretly backed by both Athens and Sparta and who appropriated much of the Delphic treasure to carry on the war.

PHOCYLIDES, fō-sil'ī-dēz, Greek poet, who flourished about 537 B.C. His poetry was made up chiefly of gnomic precepts, and only 18 fragments have been preserved. A didactic poem in 230 hexameters long passed current as the work of Phocylides, but was shown by Jakob Bernays to be a later forgery. This seems to furnish evidence of the esteem in which Phocylides was held, the only object of the anonymous author having apparently been to procure prestige for his composition by attaching to it a recognized name.

PHŒBE, fē'bē, in Greek mythology, the daughter of Oranos and Gæa (heaven and earth), mother by Zeus of Asteria and Leto. As the successor of Themis and the predecessor of Apollo she presided over the oracle at Delphi. Later poets speak of Phœbe (the radiant one) as a title of Artemis, the moon goddess.

PHŒBE, The. See ESSEX, PHŒBE AND CHERUB.

PHŒBE-BIRD. See PEWEE.

PHŒBUS, fē'būs, William, American Methodist clergyman: b. Somerset County, Md., August 1754; d. New York, 9 Nov. 1831. He entered the ministry in 1783, and was engaged upon various circuits until 1798 when he established himself as a physician in New York. In 1806 he re-entered the ministry and continued in the service until 1824, when he was placed on the retired list. He edited the *Experienced Christian's Magazine* in 1796, and wrote 'An Essay on the Doctrine and Order of the Evangelical Church of America as Constituted at Baltimore, 1784' (1817).

PHŒBUS. See **APOLLO.**

PHŒNICIA, fē-nish'ī-ā, in ancient geography, a maritime region and a Semitic kingdom with widely varying boundaries at different periods, but generally defined as the fertile coast region of Syria lying between the Lebanon range and the Mediterranean, and bounded on the south by Carmel and on the north by Latakia (Laodicea) and the country around Cyprus. The name is Greek and has been variously explained; either from *phœnix*, "a palm tree," or from *phœnix*, "red." The former etymology would allude to the palms of the country; the latter to the red brown complexion of the inhabitants, or to the scarlet dye of the murex which was a staple article of trade with this people, or to the region about the Red Sea, whence their own legends say that they emigrated. Very probably none of these explanations is correct. The native name was *Khna*, familiar to us in the form *Canaan* and signifying "the lowlands"; it was extended at an early date to cover Palestine. "Tyre and Sidon," the names of the two great Phœnician cities, were often used to include all the cities of the plain. The coast line, 200 or more miles long and broken by several sharp promontories, is followed by a narrow strip of very fine sand; inland are the fertile plains of Acre, Tyre, Sidon, Marathus, etc., varied by round hills and backed by the range of Lebanon, 130 miles in length and overgrown with the proverbial cedars and other ship timber. Besides the great cities of Tyre and Sidon there were in early times even the minor cities of Arvad, Acccho, Orthosia, Arka, Botrys, Berytus, Sarepta, Dora, etc., so that the entire country might have been defined as a series of ports practically forming one unbroken city along the sea. The geology of Phœnicia is simple with its silicious coast strip; its alluvial plains, cut by the rivers Badas (Nahr-el-Melk), Eleutherus, Orthosia (Nahr-el-Berid), Tripolis, (Kadisha), Adonis (Ibrahim), Lycus (Nahr-el-Kelb), Magoras (Beirut), Bostrenus (Nahr-el-Auly), Sidon, Litny, Sarepta (Zaherany) and Belus (Acre or Akko); and the mountain ranges of Bargylus and Lebanon, formed of an early limestone, very soft and broken now and again with igneous rocks. The sandstone is rich in iron in many localities; coal and ochre have been found and there is evidence that the Phœnicians themselves dug extensively for amber.

Commerce.—Almost as soon as they devoted themselves to farming and cattle raising in the plains and mining in the hills, the ancient Phœnicians must have begun to fish, to navigate the Mediterranean and to trade with its varied peoples. Whether they had been sailors before coming to the Mediterranean coast is uncertain; the question depends on the solution of the difficult problem of the precise origin of the people. Their own legend that they came from the region around the Red Sea would make it probable that they had known something of shipping and trade before they settled in their new home. At any rate in Phœnicia they were famous sailors and seem to have been the earliest people to dare to sail by night as well as by day, under the guidance of the north star, which they may be said to have discovered. The purple, or more exactly, scarlet dye made

of the shell of the murex; the skilful embroidery, jewelry and weaving of the Tyrian craftsmen; and glass, which if not discovered by the Phœnicians was evidently improved and largely sold by them—together with the natural products of the country—were the main articles of Phœnician export. Imports were limited only by the variety of the products of the Mediterranean Basin, the Far West, for the Phœnicians brought tin from Britain and the Far East, for Syria and Babylonia made Phœnicia a market place for exchange with Egypt, and the caravan wares of India and eastern Africa both made their way to Phœnician marts, where there was a great slave trade.

Colonization.—Phœnician colonists were no less famed than their traders and navigators. The impulse seems to have been due to the wars in Canaan, which drove the Hittites and Amorites into the northern and maritime country whence they were sent to settle in Cyprus. It seems probable that by 1500 B.C. the Phœnicians had colonies throughout the Ægean Sea. Soon afterward, at the latest, they settled in Malta, Sardinia and Sicily, where the cities of Motye, Soloeis and Machanath (later Panormus) grew up; then Hippo, Ityke (Utica) and Carthage were planted on the African coast, Carthage becoming one of the greatest maritime powers of the Old World, and about 1100 they reached the Pillars of Melkarth (or Hercules), now Gibraltar, and founded Gades (Cadiz), a western outpost and a trading station with the countries of the nearer Atlantic.

History.—The ethnology and early history of the people are alike uncertain. The Biblical account (Gen. x, 6-15) in making Sidon a descendant of Ham seems to argue for the Hamitic origin of the race. The argument against this from the Semitic character of the language is not conclusive; as in Parthia, a Turanian people adopted an Iranian language and became merged to a great degree with the Persians as concerns customs and religion, so here it is possible, at least that the Phœnicians may have been originally Hamitic and that they learned a Semitic tongue only after their settling in the eastern end of the Mediterranean. But, taking into consideration the racial type and the mental characteristics of the people, most ethnologists are agreed on their Semitic origin. Relationship with Egypt then becomes merely a matter of commerce and trade. The earliest historical mention of the country is in Egyptian monuments and evidences Egyptian control of the Phœnician cities from 1600 to 1300 B.C. Sidon then arose as a great power, withstood the Israelites and made Dan subject to her, but was unsuccessful in her attack on the Philistine city of Ascalon, which, attacking her in turn, practically broke the supremacy of Sidon. Tyre was the new leader, its supremacy beginning about the middle of the 13th century B.C., colonization being extended and the cordial feeling with the Israelites rising to its highest in the days of Hiram and Solomon. But Tyrian hegemony after 400 years nearly (1250-875) was broken by the Assyrian Empire, whose control of Phœnicia lasted, with important intervals of successful rebellion on the part of Tyre, to the last of the 7th century (about 625). Egypt first, then Babylonia, now held all Syria; and after Cyrus' cap-

ture of Babylon (538 B.C.) Phœnicia was a part of the Persian Empire up to 333. In this period much of the old maritime power of Phœnicia returned; she became in short the Persian naval outpost on the Mediterranean. This power prompted a revolt against Persia, which founded a brief period of independence before the capture of Tyre, after one of the greatest sieges in history, by Alexander the Great in 332 B.C., which closes the history of the region. Syria fell under Turkish rule in 1516.

Religion.—The precise nature of the Phœnician religion is as obscure as all Phœnician origins. Philo of Byblus (about 64-141 A.D.), himself a Phœnician, wrote in Greek on this topic in a manner that some critics consider mere euphemistic theorizing, but which others accept as actual proof that the gods were merely notable heroes of the primitive period. It seems more probable that, like most other Semitic religions, the Phœnician was a nature worship, possibly monotheistic in origin, but certainly polytheistic and extremely corrupt, vicious and depraved in historic times. Indeed almost all that is unnatural and vile in Greek cults seems traceable, at the expense of less or more ingenuity, to Phœnician influence. The wickedness of Sodom and Gomorrah and the cities of the plain was proverbial in both the Old and New Testaments; it seems to have been ceremonial and closely connected with the worship of Ashtoreth (Astarte, the *Venus Syriacâ*), and not to have been due to the ill-repute that the Phœnicians had for veracity, fidelity and honesty. The word "sodomy," from Sodom or Sidon, is in itself a sufficient commentary on Phœnician worship. Ashtoreth, on the naturalistic theory, seems to be the personification of the moon, as Baal was the sun. Melkarth, the tutelary deity of Tyre, in many respects like the Hellenic Heracles, whose very name indeed has been derived from Melkarth (read backward, as the Phœnicians wrote from right to left); Adonis, or Adonai, the god of Byblus, the complaint for whose loss seems to have fashioned a ceremonial elegy, which possibly affected the Ionian elegiac form, and whose name was substituted by the Hebrews for the sacred trilateral name of Yahweh (IOA) in their texts; and Dagon, the fish-god, are a few of the divinities which sprang up after the early monotheistic stage in which Baal alone was worshipped. Human sacrifice was practised, notably to Moloch, as we know from the Scripture narrative; and it has been suggested that prostitution as a cult rite may have had its origin in the same notion of averting the divine anger by offering up the most precious and best—an idea carried even further by the emasculated Galli. In the Phœnician temples no statues of the gods were reared, but simple cone-shaped columns.

Art and Architecture.—See article PHœNICIAN ART.

Language and Literature.—The Phœnician alphabet was the original, thanks to Sidonian and Tyrian colonies which carried it through the Mediterranean, of that of the Greeks, who reckoned Cadmus, a Phœnician, the inventor of letters. It is certain that there were earlier alphabets, for example, Egyptian and Hittite; and it seems probable that the Phœnician was derived from the

Egyptian. If so it has the virtue of simplification as it contains only 24 letters, practically those of the earlier Greek alphabet with the sign F, for a *v*, *w*, or *f* sound. The importance of this simplified alphabet, the direct ancestor of the Greek, and thus indirectly the parent of all the alphabets of modern Europe, can scarcely be overestimated. The language of the Phœnicians differed so little from Hebrew that a Hebrew scholar has little difficulty in reading it. Like the alphabet it was spread widely over the Mediterranean Basin by colonization, but as the Phœnician colonies were overwhelmed by Greece and Rome the language died out; Carthage, destroyed by Rome in 146 B.C., was probably the last place where the language was used. The result is that the greater part of our knowledge of the language is from very indirect sources such as proper names of gods, men and places, or chance citations in grammatical writings. The direct sources include only the inscriptions on coins or temple walls, votive offerings, etc. These are included in the French Academy's 'Corpus Inscriptionum Semiticarum' (1881 seq.), and their grammar is dealt with in Schröder, 'Die phönizische Sprache' (1869) and Lidzbarski, 'Handbuch der nordsemitischen Epigraphik'; they date from the 9th century B.C. to the 3d century A.D., most being between the 5th and the 2d centuries B.C. The nature of the inscriptions, their brief ceremonial form, make the Phœnician vocabulary which has come down to us consist very largely of names of divinities, the names of men and women being almost without exception compounded of god-names; and the indirect sources, as has been remarked, furnish nothing but proper names. These indirect sources are the Biblical texts, citations by Greek and Roman grammarians, and such names, preserving their Phœnician form somewhat, as occur in Greek and Latin translations of Phœnician authors. How large a literature there was in Phœnicia proper and its colonies is problematic. The work of Sanchuniathon of Berytus on cosmogony and theogony, supposed to date from 1200 B.C., is preserved in part in a Greek version by Philo of Byblus, who is reckoned by some modern scholars to have tampered with the original if original there ever was. Other names are those of the historians Theodotus and Hypsimeratus (whose clearly Greek names cast suspicion on their being actually Phœnicians), Mochus, who is said to have enunciated the atomic theory; and among African authors, Hanno, whose 'Periplus' in Greek version has come down to us, and Hiempsal, king of Numidia, Hamilcar and Mago, who all wrote on history and agriculture. Mago's work was translated into Latin by Silanus upon the order of the Roman Senate, and seems to have been used in Varro's 'De Re Rustica' and in Virgil's 'Georgics.' Virgil's description of the song of Iopas at the close of the first Æneid may prove that he knew something of Punic philosophy; Servius states that this was the case, but it is quite as likely that the outline of the theogony of Iopas is reminiscent of Sanchuniathon, or from some other Hellenic source.

PHŒNICIAN ART. The Phœnicians invented little in the domain of art; what remains of their production shows them to have been possessed of the power of assimilation and recombination so as to be able to improve upon models which they derived mainly from Babylonia, Egypt and Assyria. What they produced bore the impress of the most skilful workmen of ancient times and in their developed forms often returned to the countries whence they had sprung. Figures, identified as Phœnicians, on the walls of Rekhmara's Tomb at Thebes, erected in the time of Thotmes III, wear richly embroidered tunics and carry vases in their hands, from which may be inferred the skill already developed in embroidery and pottery-making.

It will be more logical, however, to speak first of Phœnician architecture. Few remains exist of which anything like an adequate account may be derived. The reason is two-fold; first, the temples, built of stone, were of monolithic or megalolithic structure, and disappeared, for the most part, during the succeeding supremacy of the Cananites, who used the material for their own more refined building. The domestic architecture was of wood and metal and has long since crumbled away. Enough remains, however, to enable us to form a basis for reconstructing the system upon which they worked. Contrary to the system of the Greeks, as pointed out by M. Renan, the foundation of Phœnician architecture was the carved rock and not the column. When the wall replaced the carved rock the character of the latter was not wholly lost. The keyed vault was probably unknown to them. Neither did the Phœnicians construct each architectural member out of separate stones, as was demanded by Greek taste; but instead they frequently carved as many as three or four members out of a single block of stone. The refinement of design, which results from the lines of the stone following the lines of the building, was wholly absent. Whatever the size of the block in leaving the quarry, it did not diminish in being incorporated into the building.

The existing monuments are chiefly to be found in the neighborhood of the five coast-towns,—Ruad (Aradus), Amrith (Marathus); Jebeil (Byblus); Saida (Sidon); and Sur (Tyre). At Amrith is a temple or shrine in good preservation. It stands in the centre of a rectangular area, 192 feet long by 160 broad, its foundation is block 20 feet square and 10 feet high, of living rock, showing the depth to which the surrounding area was sunk. The superstructure consists of three wall blocks covered by a roof of a single block, enclosing the interior on three sides only. No ornament is attempted save a fillet, and cornice around the exterior of the roof-block, and a shallow carved

vaulted roof on the interior. No steps lead up to the fane. A similar fane, discovered in the neighborhood by Renan during the Syrian expedition projected by Napoleon III, though not so well preserved, bears evidences of an entirely monolithic structure.

The walls of Phœnician towns were of massive stones like the foundations of temples. These were placed in superimposed courses without the use of mortar. Of all Phœnician monuments, the tombs, or structures supposedly tombs, of which there are several remaining in good preservation possess the highest architectural character. The best known are the "Maghazils" near Amrith, one of which Renan has called "a real masterpiece in respect of proportion, elegance, and majesty." This monument consists of three parts; the basement story being circular upon a square platform or plinth. Above each corner of the plinth stands an engaged lion. The second story is cylindrical, of less diameter than the base, and has a molding of delicate curve at its base and carved dentals and battlements around the upper part. The surmounting story is cylindrical, of still less diameter, crowned by similar carving and finished by a dome. The basement story consists of four blocks, while all above it is monolithic. The type of monument, though rare, may be original with the Phœnicians, as it differs from the pyramidal and the step-terraced terminations of Egyptian and Assyrian monuments.

The four lions upon the tomb are among the most important of the remains of Phœnician sculpture. They are rudely carved and bear some indications of a Mesopotamian conception of animal life, with a peculiarity of technique that allies them with the bas-reliefs or empæstic metal work by which Phœnician sculpture was almost exclusively represented. Reliefs cut in solid rock at Gineh and Mashnaka of animals and men are comparable to Assyrian sculpture, but represent humbler phases of life than that depicted upon the works of Nineveh. Movable sculpture showing Egyptian characteristics, and sarcophagi with bas-reliefs of confused Egyptian and Greek elements have been found at Saisa. Their date is assigned to a time not earlier than the Seleucidæ.

The lack of sculptured remains is due to the fact that the Phœnicians probably made their movable figures out of metal. Upon a wooden core carved either in relief or in the round, the metal was placed and hammered to fit the carvings beneath, forming a so-called sphrylaton. Bronze was the metal usually employed for ornamented vessels. Reliefs were made of copper, gold, silver and even tin; these metals being sometimes employed in connection with mosaics of precious stone, ivory and amber. The elaborately ornamented pillars, called Jachin and Boaz in Solomon's temple, the altar of gold, and the table for the show-bread, the great laver supported by lions, together with vessels, lamps, candlesticks and all implements described in 1st Kings in the Old Testament as appurtenances to the temple, were of Phœnician workmanship. The bronze dishes embossed and engraved, found by Sir Austin Layard at Nimrud and described in his 'Monuments of Nineveh,' are ascribed to Phœnician workmen of the 8th or 9th centuries B.C. The designs upon these vessels show more liveliness of fancy than artis-

tic merit. Figures of men as well as various animals natural and mythological, including the sphinx derived from Egypt, are wrought upon them. The human figures are often purposely grotesque.

In gem-cutting the Phœnicians attained a degree of excellence, while in many of the other minor arts such as ornamental jewelry, embroidery, etc., evidences of their variety and skill are not wanting. Consult Clermont-Ganneau, C., 'L'imagerie phénicienne' (Paris 1880); Fröhner, C. E. L. W., 'La verrerie antique' (Le Pecq 1879); Halbherr, O., 'L'an-trodi zeus in Creta' (Rome 1883); Menant, J., 'La glytique orientale' (Paris 1883); Perrot and Chipiez, 'History of Art in Phœnicia and its Dependencies' (2 vols., trans. by W. Armstrong, New York 1885); Rawlinson, H. C., 'History of Phœnicia' (London 1889); Renan, E., 'Mission de Phénicie' (Paris 1865-74).

PHCENISSÆ, fē-nīs'sē, a play of Euripides (q.v.). It receives its name from its chorus of Phœnician captives. The story of the play is the same as that of the 'Seven Against Thebes.' The maidens who form the chorus are supposed to be on their way from Tyre to Delphi where they were to serve in the temple, but on the outbreak of the war were detained at Thebes.

PHCENIX, fē'nīks, Ala., a city of Lee County, opposite Columbus, Ga., 76 miles north-east of Montgomery and situated on the Central of Georgia Railroad. It was founded just before the war, was incorporated in 1883, received a new charter in 1894, under which it is now governed by a mayor elected biennially and a city council. It is a city of homes with growing commercial interests. Pop. 4,555.

PHCENIX, Ariz., city, capital of the State and county-seat of Maricopa County, on the Santa Fé, Prescott and Phœnix Railroad, in the south central part of the State. A short railroad line connects Tempe, on the Santa Fé, eight miles east of Phœnix, with Maricopa, on the Southern Pacific Railroad. It was settled in 1870 and in 1881 was incorporated. It is in a mining region, where there is good farm land in the valleys. The chief industrial establishments are stock-yards, machine shops and large jobbing houses. It is a famous winter resort. Its trade is chiefly in fruits, especially oranges, honey, grain, cotton, mining products and live-stock. The prominent public buildings are the capitol, the agricultural experiment station, insane asylum, courthouse, city-hall, new Young Men's Christian Association building, Water Users' building, Federal building, churches and schools. The public school system has been developed with great intelligence, both in regard to school buildings and courses of instruction. The city has several large modern grammar schools and the High School group presents a most attractive appearance. Other educational institutions are Academy of the Sacred Heart, Saint John's Indian School (R.C.), a number of parish schools and a public library. The government is administered under the commission managerial form, put into effect May 1914. The officers are a mayor and four commissioners. The city's business is managed by a "city manager." Pop. (1920) 29,053.

PHCENIX, fabulous bird, about the size of an eagle. According to Herodotus it came from

Arabia once every 500 years to the sanctuary dedicated to it at Heliopolis, bringing with it the dead body of its parent, which it buried in the shrine. When it felt its life drawing to a close it built itself a nest, from which after its death a new phœnix rose; while other versions speak of a worm which, proceeding from the body of the dead bird, was developed into a new phœnix. According to a more modern modification of the story the bird, at the age of 500 years, built a funeral pile of wood and aromatic gums, which it lighted with the fanning of its wings, and rose from the flames with renewed life. Similar stories of birds occur in the Oriental mythologies, as, for instance, the myth of the Persian bird *simorg* and that of the Indian *semendar*. Ancient writers mention four epochs of its appearance in Egypt under Sesos-tris, under Amasis (569-525 B.C.), under Ptolemy III (247-221 B.C.), and under Tiberius (34 A.D.). In Saint Clement's epistle to the Corinthians it is used as an illustration of the doctrine of the resurrection; it had been regarded by the Egyptians as the symbol of immortality thousands of years previously; it appears on the coins of several Roman emperors as a symbol of their own apotheosis or of the dawn of a more glorious era under their reign.

PHCENIX, in botany, a genus of palms, containing such valuable species as the date-palm, sago-palm and others of northern Africa and southern Asia. See DATE-PALM; PALMS.

PHCENIX OF THE HOUSE OF HOHENLOHE, Order of. See ORDERS, ROYAL.

PHCENIX PARK, in Dublin, Ireland. On 6 May 1882 Lord Frederick Cavendish, Chief Secretary of Ireland, and Thomas Burke, the under secretary, were assassinated in this park. See DUBLIN.

PHCENIXVILLE, fē'nīks-vīl, Pa., borough, Chester County, at the junction of the Schuylkill River and French Creek, on the Pennsylvania and the Philadelphia and Reading railroads, 23 miles northwest of Philadelphia. It was first settled in 1792, and the borough incorporated in 1849. It is an important centre of the iron industry, and contains rolling mills, blast furnaces, bridge works and steel mills. It also manufactures cotton goods, hosiery, silk and matches. The borough has a public park, a hospital, a public library and good schools. The government is by a council and a Burgess who holds office for three years; the public school directors are chosen directly by the people. The waterworks are owned and controlled by the borough. Pop. 10,743.

PHOLAS. See DATE-SHELL.

PHOLUS, fō'lūs, in the Greek myth, a centaur of the Phœce, a spur of the Erymanthus range, which separated Elis from Arcadia. When Hercules visited him he opened in his honor a cask of wine, the gift of Dionysus, and the other centaurs who had joined in the revel becoming excited with the fumes of the wine fell upon Hercules with sticks and stones. Hercules fought his way out of the cave and slew many of them with his poisoned arrows, putting the rest to flight. Pholus was accidentally wounded by one of the poisoned arrows from which he died.

PHONAUTAUGRAPH. See PHONOGRAPH.

PHONENDOSCOPE, an instrument used in auscultation in much the same manner as the stethoscope, than which it is much more delicate. It consists of a shallow cup from which project rubber tubes covered with a disc of ebonite. In the centre of the disc is a small rod carrying a button on its end. The button is placed on the area under examination and the tubes are fitted to the ears of the examining physician.

PHONETIC SPELLING, a system of spelling in which the words are spelled exactly as they are pronounced, the sounds being represented by characters, each of which represents a single sound; as "stix" for sticks.

PHONETIC WRITING, is writing according to sound, the ordinary method of the stenographer. There is a more primary meaning to the phrase, referring to the rendering of languages or dialects not yet reduced to written form. For instance, a traveler reporting on native words in a little-known savage tongue, has to reproduce them phonetically, as they sound to him. This custom has resulted in a great duplication of spellings, as Hindoo and Hindu, and geographers and editors of gazeteers have had infinite trouble in trying to reduce them to reasonable system. L'Association International Phonétique has been formed as an authority to remedy many of the difficulties encountered by editors and stenographers in dealing with phonetic renderings. The respelling of title words in dictionaries and encyclopedias is done phonetically, and there is an unfortunate lack of harmony in the method of using diacritical marks to indicate the exact pronunciation. See ORTHOGRAPHY; STENOGRAPHY; SPELLING REFORM.

PHONETICS, or science of speech-sounds, is the art of producing speech-sounds and recognizing them by the ear. The organic side of phonetics describes the actions and positions of the vocal organs—throat, tongue, lips, etc.—by which speech-sounds are produced, and classifies those sounds according to their organic formation. The *acoustic* study of speech-sounds classifies them according to their similarity to the ear and explains how the acoustic effect of each sound is the necessary result of its organic formation. In common practice phonetics apply to the articulate sounds of human speech and their representation by alphabetic characters. How unsatisfactory and misleading the alphabetic system is—in the English language especially—may be shown by the similarity of spelling (ough) and the total dissimilarity of pronunciation in such words as *cough*, *rough*, *bough*, *though* and *through*, while *rite*, *write*, *right* and *wright* are all pronounced the same. The foundation of speech is the current of air issuing from the lungs through the bronchial tubes into the trachea and thence into the larynx, across the interior of which are stretched the *vocal cords*—two elastic ligaments. The breath causes these cords to vibrate and produce a musical sound—the *voice*, from which is obtained an endless variety of sounds, vowel and consonantal. The lungs are the bellows of the speaking machine; the larynx is the vocalizing part where the modifications affecting the pitch

of the voice are produced; the contraction and expansion of the vocal ligaments or glottis—the orifice of the larynx—produce the sound or voice and regulate its volume between the loud and the whisper. The pharynx, or passage between the larynx and the mouth, is a cavity susceptible of various degrees of contraction and expansion, from which the percussive effects of consonants mainly arise. In passing through the mouth the sounds receive their final shade and texture by the operation of the tongue against the palatal arch; the valvular action of the soft palate and the formation of the lips. The physiology of speech is a complex study, absolutely indispensable to an understanding of phonetics. The researches of American, British, French and German philologists have led to the construction of an alphabet by which every sound that the human voice is capable of uttering can be expressed by one invariable symbol. After many years of experiment, a "Universal Alphabet" was published by Prof. Alexander M. Bell of London in 1867 under the name of "Visible Speech," applicable to every language. It contained no "letters" in the alphabetic sense; each symbol represented an operation of the organs of speech; by following each sign the reader must inevitably produce the correct sound, whether labial, dental, sibilant, guttural or any *nuance* of a vowel sound. Applied to any other language, it removed the impossibility of reproducing foreign sounds by the somewhat clumsy system of "transliteration." In effect it was the same theory as obtains in music, where 10 musicians of different nationalities and unable to converse with each other may nevertheless perform harmoniously together in the same orchestra.

The English alphabet is the alphabet of Latin, and for that reason it is inadequate for representation of the very many vocalizations of English which are alien to Latin, for example, the several different values of the vowels. The five vowels have in Latin each two values and no more; they each represent one vowel sound long (or full) and short (or thin, *tenuis*). But the vowel signs in English stand each for several different sounds. For example, *a* stands for the several vowel sounds heard in *fate*, *fat*, *father*, *fall*, *fare*, what and in the initial syllable of *among*; *e* has at least six values, as in *we*, *wet*, *here*, *her*, *there* and the final syllable of *gotten*; *i* represents seven different sounds; *o* represents eight and *u* four. Or the sound of *a* in *lane* may be represented in other words by *ei* (*rein*) or by *ea* (*great*).

The several consonants, too, are not restricted to one sound-value: examples, *get*, *gem*; *cat*, *cent*. Consonant sounds unknown to the Latins are represented by combinations of consonants; *ch*, as in *chin* and as in *chivalry*; *th* as in *thin* and in *than*. Then, both vowels and consonants are in a large proportion of the words of the language silent. A phonetic alphabet would, as far as is possible, provide a sign for each vocalization in the language and would eliminate "silent" letters. Many alphabetic schemes to that end have been proposed, perhaps the most notable among them being the phonetic alphabet devised by A. J. Ellis of Cambridge University and Isaac Pitman, which was first published in 1847, and which since that time has been variously modi-

fied by them or by others. Though strenuous efforts have been made for the adoption of the Ellis-Pitman or other similar phonetic systems; though primers and textbooks for schools and works of general literature, including the Bible and numerous magazines and newspapers, have been printed in phonotype, and alphabetic reform has been zealously and ably advocated in England and the United States, there is as little prospect now of its adoption as there was 70 years ago or even less.

In the phonetic alphabet of Ellis and Pitman, as at first constructed, 23 of the letters of the Latin alphabet were retained, the remaining three, *c*, *q* and *x* being rejected as superfluous. Seventeen new characters were devised to represent sounds that are not represented unambiguously in the existing alphabet. Afterward the 17 new characters were reduced to 11, namely, 7 new signs for vowel sounds and 4 for consonants. In a phonetic alphabet the signs must always, in whatever position, each represent one definite sound-value and no more. The sounds represented in such an alphabet by the vowel signs *a*, *e*, *i*, *o* and *u* are the sounds which those vowels have in the words, an, ell, in, on, run.

In 1877 the American Philological Association agreed upon an alphabet, the distinguishing features of which were the use of the five vowel signs in their Latin values, and the addition of three new forms, making eight vowel symbols. By placing a macron over these the long vowel was represented; unaccented, the vowels were short. With the further development of the science of phonetics and a consequent change in the methods and aims of language study, a growing need was recognized for a rational scientific alphabet. In 1903 a committee was formed of five members representing the National Education Association, the American Philological Association, and the Modern Language Association of America, to "agree upon and promote the general adoption of the best set of alphabetic symbols to be used in dictionaries and text-books for the accurate denotation of the sounds heard in English speech." The alphabet of 1877 was adopted as the basis for the proposal. The result of the committee's labors was issued in 1904 and is generally known as the "N. E. A. Alphabet." Briefly stated, it consists of 45 symbols—18 vowel sounds, 24 consonants and three diphthongs, as being sufficiently precise for popular scientific purposes. By dropping the signs that can be most easily dispensed with in rapid writing, a "shorter alphabet" of 38 letters was arrived at.

The consonant signs in the phonetic alphabet stand for the same vocalizations which they represent in the regular alphabet, with this exception, that in the phonetic system they have only one sound: *g* is always hard, as in get, never soft as in gem, the soft sound of *g* being there represented always by *j*; in like manner *s* is always sharp, as in so, never soft as in has: the sound of *s* in has is represented phonetically by the character *z*. The sounds of *sh*, *zh*, *th* and *ng* as heard in she and nation, in leisure and occasion, in thin, in thou and in sing, have in the phonetic alphabet their proper signs, as can be seen in numerous examples of phonotypy.

The modification of the vowel signs make

them representative of vowel sounds not adequately discriminated in the existing alphabet. There the vowel sound of *o* in more, of *u* in puzzle, of *u* in delusion, of *u* in confuse and various other vowel sounds not discriminated in the regular alphabet; also the sound of *ng*, of *sion* in delusion, of *th* in truth and a number of other vocalizations of English speech, are represented unambiguously in the phonetic characters. Lord Lytton wrote: "A more lying, puzzle-headed, delusion than that by which we confuse the clear instincts of truth in our accursed system of spelling was never concocted by the father of falsehood. How can a system of education, flourish that begins by so monstrous a falsehood, which the sense of hearing suffices to contradict?"

Although the alphabetic system and orthography of the English language are notoriously chaotic, the very magnitude of the evil constitutes an insuperable obstacle to reformation. To adopt any radical phonetic system would at once antiquate all the existing literature in our language. The inconsistent orthography to which we adhere would surprise a generation that had been accustomed to a rational system; and the "ancient classics" of the year 1918 would be as irksome reading as the writings of Chaucer and Wyclif are now. The new generation would have to learn the old A, B, C and the old orthography, else those "classics" would be unintelligible to them. On the other hand the opponents of reform maintain that an educated person finds no difficulty in spelling correctly, whereas a less educated individual would probably have quite as much trouble even if the orthography were simplified. Reading is the best teacher. See LANGUAGE, SCIENCE OF.

PHONOGRAPH, an instrument invented in 1877 by Thomas A. Edison (q.v.) of Menlo Park, N. J., by means of which within a moderate radius sounds can be registered permanently and afterward reproduced from such mechanical register. The instrument as originally made consists of a mouth-piece, having a diaphragm or membrane. Connected with the centre of this diaphragm is a steel point, which

when the sounds are projected on the diaphragm through the mouth-piece vibrates and cuts a vibrating spiral groove in the surface of a rotating cylinder having also a slow endwise motion. This cylinder surface is then hardened and becomes a "record" for reproduction of the sounds. In the original phonograph a piece of tin-foil is laid round the cylinder, being kept close to it by means of gum or water, and the stand holding the mouth-piece is brought close to one end of the cylinder; the steel point of the diaphragm is then adjusted so as to be just touching or close to the tin-foil, and above the line of spiral groove. It will be seen, then, that any movement of the steel point due to the motion of the diaphragm will cause a slight indentation of the tin-foil, which will by such movement be slightly depressed into the groove beneath it; and if the cylinder be rotated, that the steel point will, from the pitch of the groove and screw being alike, always be over the line of groove. If the instrument be then set as above described, and some words be spoken into the mouth-piece, while at the same time the cylinder is kept in rotation, a series of minute marks are made upon the tin-foil by the movements of the steel point, and these markings have all an individuality of their own, due to the varying sounds addressed to the mouth-piece. So far a *register* only of the sounds emitted has been obtained, and we have now to show how these sounds in this manner, fixed as it were on the tin-foil, can be reproduced. To effect this the mouth-piece must be drawn back and the cylinder rotated in the reverse direction to what it was at first, so as to bring the same part of the tin-foil with which the operation commenced back to the point at which it started, namely, opposite the steel point. The diaphragm with its steel point is then approached toward the tin-foil as at first and is now resting upon the same point of the tin-foil as it had previously first indented. The cylinder is now rotated as at first, with the result that the small indentations or sound markings made previously now act upon the steel point by causing it to rise or fall or otherwise move as the markings pass beneath it; the result of this is that the diaphragm in connection with the steel point is thrown into a state of vibration exactly corresponding to the movements induced by the forms of the markings and thus affects the air around so as to produce sounds, and these vibrations being exactly similar to those originally made by the voice necessarily reproduces these sounds to the ear as the words at first spoken. The diaphragm in this way acts as the medium of transmission of sounds to be registered on the tin-foil, and as the medium of reproduction of these sounds from the metallic register on which they have been impressed.

In Edison's improved phonograph (1895) tubes of wax are used instead of the tin-foil, the cylinder fitting into the inside of the tube, and the markings being made on the surface of the wax by a fine steel point. This familiar type of phonograph has a horizontal mandrel or shaft, on which the cylinder turns by the pressure of a spring, which is usually wound by a hand crank. The hollow cylinder record is slipped on the cylinder which is uncovered at one end for that purpose. The diaphragm or reproducer, which holds the horn, travels along

the cylinder, following the spiral indentations of the record. The wax cylinders can be used several hundred times, the machine being fitted with a small paring tool which will shave off the record previously made, leaving a smooth new surface. The machine has also been supplemented by the inventor with an ingenious little electric motor with delicate governing mechanism, so that the phonograph can be operated at any chosen rate of speed, uniformly. This motor derives its energizing current either from a storage battery or an electric-light circuit.

The cumbersomeness of phonograph cylinder records, which required great room for storage, led to the marketing in 1897 of machines in which a disc carried the record, those being frequently called gramophones or graphophones (q.v.). The discs had the advantage of permitting longer records. A prominent machine of this type is the Victrola. In the disc machines, a turntable replaces the cylinder, and this turntable supports and rotates the disc record, which is clamped fast. A needle of steel, wood, etc., is used to travel in the indentation and impart the vibrations to the diaphragm in the sound-box. The Dictaphone is another development, also the Detectograph, all of which employ the fundamental principles described. The greatest demand has proved to be for records of popular songs and instrumental music. Automatic phonographs are to be found in many places of public resort, equipped with musical or elocutionary cylinders, which can be heard upon the insertion of a small coin; and miniature phonographs have been applied to dolls and toys. The value of the phonograph in the preservation of dying languages has been perceived, too, and records have already been secured of the speech, songs, war-cries and folklore of American tribes now becoming extinct. It is also worthy of note that several voice records remain of distinguished men who "being dead yet speak." Their tones can now be renewed at will and their very utterances, faithful in accent and individuality, can be heard again and again through all time.

The manufacture of phonographs and graphophones has become an industry of some importance in the United States. The production in 1899 was valued at \$1,240,000; rose to \$5,438,000 in 1909 and to \$11,525,000 in 1914. The production of records and blanks is about \$5,000,000 annually. There has been much increase in the quality and the value of the individual machines, also in the size and quality of the musical records, especially the discs. In 1914 there were 18 establishments engaged in the industry, employing about 10,000 persons and capitalized at almost \$34,000,000.

PHONOGRAPHY. See **SHORTHAND**.

PHONOLITE (Clinkstone), in *geology*, a compact gray or green volcanic rock of feldspathic or porphyritic texture consisting largely of orthoclase, nepheline, pyroxene and sometimes leucite. Found in the United States principally as dikes in the Black Hill region and in the Cripple Creek mining district. More widely distributed in Europe, being found in many parts of Germany and in the volcanic region of central France. Also found in the Cape Verde Islands. Many phonolites crack up internally into a number of parallel plates so that the

stone gives a peculiar sound when struck with a hammer, hence the name.

PHONOMETER, an instrument, usually self-registering, for ascertaining the number of vibrations of a given sound in a given space of time.

PHONOSCOPE, an apparatus for testing the quality of musical strings, invented by Koenig. Also a combination of an induction coil and battery with a rotating vacuum tube, for translating vibrations of sound into visible figures.

PHORBAS, fôr'bas, in the Greek myth, a son of Lapithes, father of Augea and Aktor. He was asked by the Rhodians for his assistance in freeing their island from serpents, and for his services was honored as a hero. Many identify him with the constellation Ophiuchus.

PHORCYS, fôr'sis, **PHORCYN**, or **PHORCUS**, an aged sea god, according to Homer; according to Hesiod a son of Pontus and Gæa (sea and land). He was brother of Nereus and Ceto, of whom he begot the Graiæ and the Gorgons, and the dragon Ladon that watched over the golden fruit of the Hesperides. He is also called the father of the nymph Thoosa, who was the mother of Cyclops Polyphemus, the maidens Hesperides, the Sirens and Scylla.

PHORMINX, an ancient Grecian lute or lyre.

PHORMIO, fôr'mi-ō, a comedy by Terence, produced in 161 B.C. It was copied from a comedy of Apollodorus and in turn copied by Molière in 'Fourberies de Scapin.'

PHORMIUM. A silky fibre obtained from a plant (*Phormium tenax*) found in New Zealand, the Chatham Islands and Norfolk Island. It was introduced in 1789 in Great Britain and continental Europe. It grows abundantly in the southern part of Ireland and also on the west coast of Scotland. The plant receives its name of "Phormium" from the Greek φoρμiός, a basket, because of the use made of its leaves by the people of New Zealand. The leaves are "thick, stiff and leathery," and the flowers bright red or yellow and from one to two inches long. It grows best along streams. Among the Maoris the fibre is used for cloaks, mats, fishing-lines, etc. Phormium is prepared very carefully by the natives, but the process is very wasteful. After its importance had been recognized machinery was invented to free the fibre from the leaves. As this means, however, produced an inferior fibre, a reward was offered by the government of New Zealand in 1893 for the invention of a machine which would produce a satisfactory fibre. The fibre is becoming popular as a material for binder-twine on reaping machines.

PHORONIS, a marine animal of the class *Phoronidea*. It is worm-shape, with long slender body enclosed in a leathery tube. At the mouth is a circlet of tentacles. It abounds on the New England coasts and in Europe. They are also found on the shores of Australia. Consult Harmer, S. F., in 'Cambridge Natural History' (Vol. II, London 1899).

PHORORHACHOS, fô-rô-râ'kôs, a huge fossil bird of the Miocene Age, several species of which are found in the rocks of eastern

Patagonia. It was as large or larger than an ostrich, and is "remarkable for the immense size and heavy build of the skull, to which the legs, huge though they sometimes are, bear no proportion; the maxilla is exceedingly compressed, yet very deep, and ends in a strong hook, while the long massive mandible curves upward to meet it." The bird must have resembled in appearance a great, thick-legged ostrich, with the head of a still greater hawk. Its relationships are in dispute, and it is not even certain that it is ratite, the sternum not having yet been disclosed. Evans, 'Birds' (1900), places it in the same group as the epiornis; while Dr. Gadow and others regard it as representing the ratite *Stereonithes*.

PHOSGENE, fôs'jên or -jën, in chemistry, COCl_2 , carbonyl chloride, phosgene gas, carbon oxychloride, was first obtained by Davy (1812) by direct union of carbon monoxide (CO) and chlorine in sunlight and is still made by same process. A colorless gas with suffocating odor and very disagreeable effect on respiratory organs; on cooling or under pressure it condenses to a low boiling liquid. A very active chemical agent, used in the manufacture of various chemical substances, particularly dye stuffs, it comes on the market as liquid under pressure in steel cylinders or in solution in toluene.

PHOSPHATE FERTILIZERS. See FERTILIZERS.

PHOSPHATE ROCK. See MINERAL PRODUCTION OF THE UNITED STATES.

PHOSPHATES. See PHOSPHORIC ACID.

PHOSPHINE. See PHOSPHORUS.

PHOSPHOR-BRONZE, an alloy made by fusing phosphor-tin with copper. It usually contains 0.053 to 0.76 phosphorus and 8 to 12 per cent of tin. The effect of the phosphorus is probably to reduce action on the oxides of the other metals during the process of manufacture. Phosphor-bronze is of finer grain and color than ordinary bronze. It is as tough as wrought iron, more ductile than copper, is completely homogeneous and shows great resistance to wear. Because of these qualities it is largely employed for bearings, wire and cannon. It was invented about 1870 by two Belgian metallurgists.

PHOSPHORESCENCE, a term formerly used to indicate a variety of phenomena consisting in the production of light without the concomitance of such a degree of heat as is associated with normal combustion. Besides the luminescence of living organisms (see PHOSPHORESCENCE IN LIVING ORGANISMS) these phenomena comprise thermoluminescence, or the luminescence of substances such as fluorspar below ordinary red heat (only after exposure to light however); triboluminescence or luminescence, such as that of sugar, due to cleavage, friction or similar mechanical means; crystalloluminescence, exhibited by arsenious acid, taking place during crystallization from fusion or solution; chemiluminescence, or the formation of light in a chemical reaction without corresponding heat, as in the case of phosphorus; electroluminescence, or luminescence excited by electrical means, which takes place in many gases upon the passage of an electrical discharge; and photoluminescence, or lumines-

cence upon exposure to light. When photoluminescence lasts only so long as the light that causes it, it is known as fluorescence (q.v.), but if it remains after the inducing light has ceased, it is called phosphorescence in the strict sense current at the present time. This is shown by a large number of substances — perhaps the majority — in some slight degree, and is especially characteristic of the sulphides of the alkaline earths, if these are prepared artificially. It appears that this phosphorescence is partly due to the presence of minute, but definite, proportions of foreign substances. Solid fluorescent substances invariably manifest some degree of phosphorescence, but this is not exhibited by fluorescent liquids, unless these are rendered solid by freezing or gelatinization or some similar process. The color of the phosphorescence of a substance depends on a large number of imperfectly understood factors, but is almost invariably, if not quite, of longer wave-length than the stimulating rays. Phosphorescence may be caused by invisible light-rays, such as ultra-violet rays or X-rays. Cathode rays and the radiations from radium and allied substances will produce effects much like ordinary phosphorescence.

The duration of brief periods of phosphorescence is measured by instruments known as phosphoroscopes. These consist of a dark chamber in which is the substance to be examined. This has two openings, obstructed by shutters so arranged that the shutter at one end is open when that at the other end is closed and vice-versa. Light is admitted to the phosphorescent substance through one opening, and it is examined through the other. It is clear that by causing the alternating action of the shutters to take place with sufficient speed the briefest phosphorescence will appear to the observer like a continued glow, and that by comparing the intensity of this glow with the form and speed of the shutters the duration of phosphorescence can be measured. Consult Becquerel, 'La lumière' (Paris 1867); Winkelmann, 'Handbuch der Physik' (Vol. VI, Leipzig 1906).

PHOSPHORESCENCE IN LIVING ORGANISMS. Many living organisms, both in the animal and in the vegetable kingdom, exhibit an ability to give off light. This light is characterized by the almost perfect efficiency with which it is generated. As much as 97 per cent of the radiation from the phosphorescent organism lies within the bounds of the visible spectrum. This contrasts strongly with the efficiency of all other forms of illumination. The best artificial illumination has an efficiency of about 10 per cent, while the efficiency of the sun is not far from one-third. Phosphorescence is observed in the animal kingdom among Radiolarians; the pelagic Cystoflagellate *Noctiluca*; certain medusæ, polyps and Ctenophores; Rotifers; Chaetopod worms such as *Chaetopterus*; some Polyzoa; *Pholas* and other Molluscs; Copepoda and deep-sea Crustacea; Myriapods; certain May-flies; Elaterid beetles of the genus *Pyrophorus*; the *Lampyridæ* or common fire-flies; Ascidians, and many deep-sea fishes. The phosphorescence of pelagic forms often causes the sea to appear a mass of light. In the vegetable kingdom certain bacteria and saprophytic fungi show a most marked

phosphorescence and cause the fox-fire often seen on rotten stumps. Phosphorescence in most cases, if not in all, is due to the slow oxidization of some fat-like substance in the presence of water. In multicellular animals this oxidation usually takes place in the products secreted by certain glands on the integument. These glands are well innervated and sometimes the entire luminescent organ consists simply of a gland or glands, together with the nerves pertaining thereto. On the other hand, the luminescent organ, instead of being of this simple diffuse sort, may possess a high degree of organization. It may have a reflector, a lens and an iris diaphragm, as in the case of the organs of many deep-sea fishes. These are located in a variety of different positions, but there is a general tendency to group them on the head. They enable the fish to find its prey and to avoid its enemies in the dark abyss of the sea. Sometimes they may serve as bait, in cases where they are found on barbels dangling near the mouth. In other cases their chief purpose may be that of making recognition possible.

PHOSPHORIC ACID, in chemistry, an acid substance formed by the union of phosphorus pentoxide (see PHOSPHORUS) with the elements of water. The combination may occur in three proportions. When one molecule of the pentoxide combines with three molecules of water, the resulting acid is called "orthophosphoric acid"; when one molecule of the pentoxide combines with two molecules of water, the acid is called "pyrophosphoric acid"; and when one molecule of the pentoxide combines with one molecule of water, the acid is called "metaphosphoric acid."

Orthophosphoric Acid.—This is the compound which is always understood, when "phosphoric acid" is mentioned without further qualification. It has the chemical formula H_3PO_4 , and may be prepared, as indicated by the equation $P_2O_5 + 3H_2O = 2H_3PO_4$, by dissolving phosphorus pentoxide in water, and boiling the solution. This acid is also formed when phosphorus is heated with nitric acid, red fumes composed of the lower oxides of nitrogen being evolved, while the phosphorus is simultaneously oxidized, passing into solution in the form of phosphoric acid, H_3PO_4 . Pure phosphoric acid (that is, orthophosphoric acid), when free from water, forms a thick, semi-solid mass, with a specific gravity of about 1.88, and it may be obtained in the form of tabular crystals, by evaporating the nearly anhydrous acid in a vacuum, over concentrated sulphuric acid. The crystals melt at $107^\circ F.$, and the liquid formed from them solidifies again, when cooled to $100^\circ F.$, the temperature at the same time spontaneously rising to $105^\circ F.$ The crystalline and the syrupy forms both dissolve freely in water, and both deliquesce when exposed to the air. The phosphoric acids form salts, which are known as "phosphates." Common, or orthophosphoric acid, is tribasic, each of its hydrogen atoms being replaceable by a monovalent base. With sodium, for example, it forms three definite, crystallizable compounds. Common neutral sodium phosphate, or "hydrogen di-sodium phosphate," may be obtained in the form of large, transparent, rhombic prisms, by neutralizing phosphoric acid by sodium carbonate, and

evaporating the solution. The crystals have the composition $\text{HNa}_2\text{PO}_4 + 12\text{H}_2\text{O}$. If sodium hydrate is added to a solution of this salt, needle-like crystals of sodium subphosphate, or "tri-sodium phosphate," are obtained upon evaporation, these having the formula $\text{Na}_3\text{PO}_4 + 12\text{H}_2\text{O}$. If on the other hand excess of phosphoric acid be added to a solution of the common phosphate, evaporation yields crystals of sodium superphosphate, or "dihydrogen sodium phosphate," $\text{Na}_2\text{NaPO}_4 + \text{H}_2\text{O}$. An orthophosphate is known as "primary," "secondary," or "tertiary," according, as one, two or three of the hydrogen atoms of the acid are replaced by a monovalent base. With calcium, orthophosphoric acid forms three well-defined compounds. The normal phosphate, $\text{Ca}_3(\text{PO}_4)_2$, occurs native as the mineral "phosphorite," and also, combined with the fluoride or chloride of calcium, as "apatite." It is likewise an essential constituent of bones, forming about 85 per cent of the weight of their ash. It may also be prepared, artificially, by adding phosphoric acid to a solution of calcium chloride, when it is obtained in the form of a white, amorphous powder. Calcium phosphate, in some form, is an essential constituent of fertile soil, as it is needed for the growth of plants. The normal phosphate, just described, is capable of furnishing both the phosphorus and the calcium; but since it is nearly insoluble, it is not readily absorbed by the plant. By the action of strong sulphuric acid, the normal phosphate, $\text{Ca}_3(\text{PO}_4)_2$, is converted into a soluble compound which has the formula $\text{CaH}_2(\text{PO}_4)_2$, as indicated by the equation $\text{Ca}_3(\text{PO}_4)_2 + 2\text{H}_2\text{SO}_4 = \text{CaH}_2(\text{PO}_4)_2 + 2\text{CaSO}_4$. The compound $\text{CaH}_2(\text{PO}_4)_2$ is known as "monocalcium phosphate," or (commercially) as "superphosphate of lime," and is prepared artificially on the large scale, from bones and the mineral phosphates of calcium, for use as a fertilizer, for which it is especially adapted by reason of its solubility. Commercial phosphoric acid is prepared chiefly from superphosphate of lime, but the process is a somewhat involved one, and for it the treatises on technological chemistry must be consulted. Pure phosphoric acid, for use in medicine and in the laboratory, is usually prepared by the oxidation of phosphorus, as described above. Dicalcium phosphate, CaHPO_4 , may be prepared by precipitating a solution of calcium chloride with ordinary sodium phosphate, Na_2HPO_4 . It is of far less importance than either of the other phosphates of calcium. Many other compounds of orthophosphoric acid with metallic bases are known, and many of these are used both in the laboratory, and in the arts. Numerous double salts are also known, in which the hydrogen of the acid is replaced partly by one base, and partly by another. Of these, the hydrogen-ammonium-sodium phosphate, or "microcosmic salt," $\text{HNaNH}_4\text{PO}_4 + 4\text{H}_2\text{O}$, deserves special mention, since it is greatly used in the laboratory. It may be prepared by crystallization from a solution containing five parts by weight of crystals of common sodium phosphate, $\text{Na}_2\text{HPO}_4 + 12\text{H}_2\text{O}$, and two parts of secondary ammonium phosphate, $(\text{NH}_4)_2\text{HPO}_4$.

Pyrophosphoric Acid.—When concentrated orthophosphoric acid is heated to 415°F ., until it yields, with silver nitrate, a white precipitate (instead of a yellow one), it becomes converted into a different compound, which is known

as "pyrophosphoric acid," has the formula $\text{H}_4\text{P}_2\text{O}_7$, and is tetrabasic. The change consists in the loss of a molecule of water, as may be seen by writing formulæ for orthophosphoric and pyrophosphoric acids in the respective forms: $2\text{H}_2\text{PO}_4 = \text{P}_2\text{O}_5 + 3\text{H}_2\text{O}$, and $\text{H}_4\text{P}_2\text{O}_7 = \text{P}_2\text{O}_5 + 2\text{H}_2\text{O}$. The salts of pyrophosphoric acid are much more important than the acid itself, and are known as "pyrophosphates." They may be prepared most readily by the action of heat upon the secondary orthophosphates. Thus if common (that is, secondary) sodium phosphate, Na_2HPO_4 , be heated to redness, it loses the elements of water, and becomes converted into normal sodium pyrophosphate, $\text{Na}_4\text{P}_2\text{O}_7$, as indicated by the equation $2\text{Na}_2\text{HPO}_4 = \text{Na}_4\text{P}_2\text{O}_7 + \text{H}_2\text{O}$. This salt can be dissolved in water and crystallized, for it does not readily take up water again, so as to be reconverted into the ordinary orthophosphate. The pyrophosphates are transformed into orthophosphates, however, upon being strongly heated with an alkali or an alkaline carbonate, and also when boiled in aqueous solution with the stronger acids. Several of the pyrophosphates, especially those of iron, are used in medicine.

Metaphosphoric Acid.—When phosphorous pentoxide, P_2O_5 , is dissolved in cold water, it combines with one molecule of the water to form an acid which has the formula HPO_3 ; the equation being $\text{P}_2\text{O}_5 + \text{H}_2\text{O} = 2\text{HPO}_3$. The same compound may be obtained in the form of a glassy, ice-like mass, by heating anhydrous orthophosphoric acid to 750°F . The vitreous mass so obtained is known as "glacial phosphoric acid." It dissolves in water to form a solution of metaphosphoric acid, and if the solution is allowed to stand for a time and is then boiled, it becomes converted into ordinary orthophosphoric acid. Metaphosphoric acid forms salts, which are known as "metaphosphates"; but these are of much less importance than the orthophosphates and pyrophosphates.

Phosphatic Fertilizers.—Apatite (q.v.) has been used to some extent as a fertilizer, but rock phosphate, in which the phosphoric acid has probably resulted from organic matter, constitutes the greatest source. It usually occurs as concretions or thin beds in sedimentary rock. Florida is the largest producer, the supply coming from rocks of Tertiary age. Phosphate of similar age occurs in South Carolina. The Tennessee beds occur in rocks of Ordovician and Devonian age. Large reserves, as yet practically untouched, exist in Carboniferous rocks in Utah, Idaho and Wyoming.

PHOSPHOROSCOPE, an apparatus consisting of glass tubes arranged in a box and containing phosphorescent substances, as the sulphides of lime, strontium, barium, etc. When this is exposed to the sun's rays or to the light emitted by a gas-burner or burning magnesium, and then removed to a dark place, each tube appears to glow with light of a different color, as red, blue, green, etc. Also an instrument devised by Becquerel for measuring the duration of phosphorescence in different substances.

PHOSPHOROUS ACID, a compound of phosphorus, oxygen and hydrogen, possessing acid properties, and having the chemical formula H_3PO_3 . It may be prepared by acting upon phosphorus trichloride (see PHOSPHORUS) with water, as indicated by the equation $\text{PCl}_3 +$

$3\text{H}_2\text{O} = \text{H}_3\text{PO}_3 + 3\text{HCl}$. Hydrochloric acid, it will be seen, is formed at the same time; but this may be expelled by boiling. The solution, when concentrated by evaporation in a vacuum and allowed to cool, deposits crystals of phosphorous acid. These melt at about 160°F ., and, when heated somewhat more strongly, decompose with the formation of phosphoric acid, H_3PO_4 , and phosphine, PH_3 . Phosphorous acid is dibasic, only two of its hydrogen atoms being replaceable by bases. It forms a series of salts known as "phosphites," those of the alkali metals being soluble, while the others are mostly insoluble.

PHOSPHORUS (Greek, "light-bearer"), a non-metallic element, first prepared in the elementary form, about 1669, probably by Brand; although its discovery is also attributed to Boyle and to Kunkel. Phosphorus never occurs free in nature, but it forms an essential part of numerous minerals, prominent among which are apatite and phosphorite. It occurs in bones in considerable quantity, combined with lime, oxygen and organic matter; and the extensive beds of fossil bones that occur in the Carolinas and elsewhere are regularly worked for the sake of the calcium phosphate they contain. Phosphorus also exists in various organic substances, notably in brain tissue, in blood and in the yolks of eggs. Chemically phosphorus has the symbol P, and an atomic weight of 31.04, when that of oxygen is taken as 16.

Phosphorus was formerly prepared by reducing monocalcium phosphate by heating it with charcoal—the monocalcium phosphate being first obtained by the action of sulphuric acid upon tricalcium phosphate (or bone-ash). This process, which was cumbersome and expensive, has now been almost entirely replaced by the continuous electric-furnace process of Readman, Parker and Robinson. Bone-ash or phosphate rock can be used equally well as the source, and the furnace (which is of the vertical-electrode arc type) is charged with a mixture of one of these substances with charcoal and silica. The silica is added partly to increase the yield (because only two-thirds of the phosphorus is reduced by carbon alone) and partly to cause the slag to take a fluid form, so that it can be drawn off easily from the furnace, thus keeping the furnace clean. The products (in addition to the fusible slag) are phosphorus vapor and carbon monoxide, as indicated by the equation $\text{Ca}_3(\text{PO}_4)_2 + 3\text{SiO}_2 + 5\text{C} = 3\text{CaSiO}_3 + 2\text{P} + 5\text{CO}$. The yield of phosphorus, by this method, is said to be about two pounds per electrical horse power, per 24-hour day.

Phosphorus may be easily freed from sand, carbon and other solid particles by melting it under warm water and filtering it through canvas or chamois. It may also be purified by distillation from iron retorts.

Pure phosphorus, when prepared as described above, is a colorless, whitish or yellowish, semi-transparent, waxy solid, with a specific gravity of about 1.82, and a specific heat of about 0.19. It becomes brittle at low temperatures, melts at 110°F . under water and at 86°F . when dry, and distills, under ordinary atmospheric pressure, at 516°F . Melted phosphorus may often be cooled to a point considerably below its point of fusion before it again solidifies. It may be

obtained in the form of crystals by fusing and cooling it in considerable quantities, or by subliming it in a vacuum, or by evaporating its solution in carbon disulphide. Phosphorus, in the form here described (which is called its "ordinary" form), is exceedingly inflammable. It should never be touched with the fingers, as it is liable to take fire from their warmth; and it should always be stored and manipulated under water.

When "ordinary" phosphorus is heated for some hours to about 500°F . in an atmosphere composed of some gas that will not combine with it, it becomes converted into an amorphous, red, allotropic modification, whose properties are quite different from those described above. Thus the red variety has a specific gravity of 2.25, is entirely insoluble in carbon disulphide, does not melt even when heated to redness in a sealed glass tube, and takes fire in the air only when heated to 500°F . Ordinary phosphorus glows in the dark when exposed to the air, the element taking its name from this circumstance. The red allotropic form, however, does not exhibit any such luminosity. Ordinary phosphorus is poisonous, and when handled in considerable quantities by persons with defective teeth, it often induces necrosis of the jaw-bone. Red phosphorus is pronounced, by nearly all authorities, to be non-poisonous; and if it has poisonous properties, they are certainly far less marked than those of the ordinary variety. Ordinary phosphorus is superficially converted into the red allotropic form by the action of light, its surface first becoming yellow, and then passing into a red. In the presence of a small quantity of iodine, the transformation of the ordinary form into the allotropic one is effected by heat with great facility.

Other allotropic varieties of phosphorus have been described, but their existence is not yet generally admitted. Hittorf, for example, dissolved phosphorus in melted lead, allowed the mass to cool, and then dissolved the lead in nitric acid. Violet-black crystals remained behind, which were composed chiefly of phosphorus; but they have never been obtained entirely free from lead and it is possible that their character is determined by the lead and other impurities present.

When phosphorus is heated in contact with air, it burns with a brilliant flame, and with the formation of clouds of "phosphorus pentoxide," P_2O_5 . These may be collected in the form of a white, amorphous powder, which absorbs moisture with avidity, and hence is used in the laboratory for drying gases. The pentoxide dissolves in water with a hissing noise, its solution constituting the compound known as phosphoric acid (q.v.). With hydrogen, phosphorus forms a gaseous compound known as phosphoreted hydrogen, or "phosphine." This has the formula PH_3 and is best prepared by the action of caustic potash and water upon ordinary phosphorus; potassium hypophosphite, KPH_2O_2 being formed at the same time, in accordance with the equation $3\text{KOH} + 4\text{P} + 3\text{H}_2\text{O} = 3\text{KPH}_2\text{O}_2 + \text{PH}_3$. Phosphine is a colorless gas with an offensive odor suggestive of decomposing fish and it takes fire spontaneously upon contact with the air. The spontaneous inflammability appears to depend, however, upon the presence of traces of another hydride having the composition P_2H_4 .

Chlorine combines directly with phosphorus, forming phosphorus trichloride, PCl_3 , which is an oily liquid boiling at 169°F ., and having a specific gravity of 1.61. The trichloride absorbs chlorine readily, forming a yellowish, solid pentachloride, PCl_5 .

Phosphorus, on account of the facility with which it ignites under the influence of frictional heat, has long been used in the manufacture of matches and until recently the familiar "strike-anywhere" matches of our every-day experience had tips composed of ordinary phosphorus, combined with manganese dioxide, chalk, coloring matter and glue, or with other analogous substances. Necrosis of the jaw-bone (already mentioned above) was pitifully common, however, among the workers in match factories using the ordinary (or white) variety of phosphorus. Finland, in 1872, forbade the manufacture or sale of matches containing it, and similar action was subsequently taken in certain other countries. As a sequel to an international convention held in 1906, at which the match problem was considered, most of the leading nations agreed to discontinue the manufacture of the white-phosphorus match. England and the United States declined to enter the pact, but England reversed her decision shortly afterward, thereby leaving the United States the only important nation that still permitted the manufacture and use of matches of this kind and thrusting upon us the unenviable distinction of having phosphorus necrosis (or "phossy jaw"), known as a distinctively American occupational disease. This state of affairs was remedied by an act passed by Congress in April 1912, which taxed the white-phosphorus match out of existence and forbade the subsequent importation, exportation or sale of such matches; and with the enforcement of this act necrosis of the jaw, as an occupational disease, practically disappeared.

The "strike-anywhere" match that we now use depends for ignition upon the use of the sesquisulphide of phosphorus, which is practically non-poisonous. The sesquisulphide match was invented in France, and in 1912 the patent rights to it, in the United States, were owned by the Diamond Match Company. That corporation voluntarily surrendered them, however, and gave the sesquisulphide patents to the public without compensation and subject only to the condition that Congress would make the white phosphorus match illegal.

For the tips of "safety" matches, a mixture of potassium chlorate, potassium bichromate, antimony trisulphide and minium is often used. This will not ignite readily by ordinary friction, but takes fire easily when drawn across a surface coated with antimony pentasulphide and red phosphorus.

Phosphorus is used in considerable quantities as an essential constituent of various poisons for rats and other animal and insect pests. "Bologna phosphorus" does not contain any true phosphorus, but consists of calcined sulphide of barium (see **BARIUM**), taking its name from the marked phosphorescence that it exhibits after exposure to a bright light.

PHOSPHORUS, in astronomy, a name given the planet Venus as the morning star;

also called Lucifer (q.v.). When it is an evening star it is known as Hesperus and Vesper.

PHOSPHORUS, Poisoning by. See TOXICOLOGY.

PHOTIUS, fō'shī-us, Byzantine scholar: b. Constantinople, 820; d. Armenia, 891. When he held the office of Secretary of State under the Emperor Michael III, the patriarch Ignatius incurred the displeasure of the weak and profligate Michael, was deposed, imprisoned and sent into exile and Photius was raised from the standing of a layman to the patriarchal dignity in his place. The installation was recognized by the metropolitans of the patriarchate, but opposed by Pope Nicholas I, whom Photius soon after excommunicated. But the Emperor Michael having been murdered in 867 by Basil, who was raised to the throne, that prince immediately replaced Ignatius in his office and banished Photius, who, however, resumed his dignity on the death of Ignatius in 878. On the accession of Leo, son of Basil, in 886, Photius was again deposed and banished to a monastery in Armenia, where he died. His death might have put an end to the division he had occasioned between the Greek and Latin churches, had not the popes refused to acknowledge the priests and bishops ordained by him and insisted upon their degradation. It is now difficult to arrive at a correct estimate of the character of Photius; for, while his biographers of the Roman Catholic Church ascribe to him craft, violence and perfidy, the Greek Church has canonized him. He was an able man of the world, but not influenced by the principles which befitted his sacred office; yet he was probably not below the average of the statesmen prelates of his age. His chief writings are (1) 'Myriobiblion,' an extensive review of ancient Greek literature by a scholar of erudition and judgment. The best edition is that of Bekker (1825). (2) 'Nomocanon' (q.v.). (3) A Greek Lexicon, of which editions have appeared at London (1822) and Leyden (1864-65). A collection of letters (Greek and Latin, London 1651). (5) A treatise on the Holy Spirit, maintaining the "Single Procession." Consult Migne, 'Patrologia Græca,' Vol. 101-104 (1860); Hergenröther, 'Photius, Patriarch von Konstantinopel' (1867-73).

PHOTO-CHEMISTRY, that branch of chemistry which deals with the chemical changes that are produced by the agency of light. The earliest observed photo-chemical phenomena were the fading of dyes and other colors in a strong light and the bleaching of linen and similar fabrics, under the influence of sunlight. The oldest known example of the power of light to induce chemical change in an inorganic substance is undoubtedly the blackening of silver chloride—a phenomenon which has been familiar to chemists since the 16th century. The number of known photo-chemical phenomena is so great as to be almost past enumeration. The most important of them all is the decomposition of carbon dioxide gas by the green coloring matter (chlorophyll) that occurs in the leaves of plants; for it is by means of this decomposition that plants obtain the greater part of the carbon they subsequently utilize in the formation of wood and of starches and sugars and other analogous food-stuffs. The

carbon dioxide gas that exists in the air is absorbed by the chlorophyll corpuscles in the leaves, and is split up, under the influence of sunlight, into carbon and oxygen. The oxygen is liberated in the free state (in large measure) and is permitted to escape again into the air. The carbon does not appear to be set free in the elementary state at any stage in the process, but is retained in the leaves in the form of some chemical combination with hydrogen and (probably) oxygen. The precise chemistry of the change is not definitely known; but as Sachs says, the "first obvious product" which is formed in the leaves is starch.

In the blackening of silver chloride there appears to be an elimination of chlorine, and, under ordinary circumstances, a simultaneous absorption of oxygen; the silver chloride (AgCl) being partially converted into an oxy-chloride, whose formula has been given as Ag_2OCl_2 by Hodgkinson, and as Ag_2ClO by Baker. Light acts in an analogous manner upon the other haloid salts of silver; but it appears that the decomposition can never proceed far, in any case, unless some substance is present which is capable of absorbing the liberated halogen. Moisture suffices as the absorbent in the case of the chloride and bromide of silver; but its sufficiency in the case of the iodide depends upon the way in which that salt is prepared. In photography, all three of these salts of silver are used, the chloride being employed in the preparation of positive prints, while the bromide and iodide are used in the manufacture of the negative plates. It is probable that an organic compound of silver is formed in the course of the manufacture of the emulsions employed in modern dry-plate photography, this organic compound being (as experience indicates) exceedingly sensitive to the action of light, becoming transformed with extraordinary facility into unstable compounds which are readily reducible by the subsequent action of the reducing agents that are technically known as "developers."

It was formerly customary to consider sunlight as divisible into three essentially different kinds of rays, which were known, respectively, as "heat rays," "light rays" and "actinic (or chemical) rays"; heat rays including those parts of the radiation which are distinguished by a relatively long wave-length, and which are mostly confined to the red and the infra-red parts of the solar spectrum; light rays including those parts which strongly affect the human eye; and actinic rays including those parts of the total radiation which are capable of effecting chemical changes and which were formerly considered to be mostly confined to the violet and ultra-violet parts of the spectrum. In modern physics this distinction has largely disappeared, especially with respect to the actinic rays; for while it is still admitted that chiefly the violet and ultra-violet rays are concerned in the reduction of silver salts, it is also recognized that many other chemical changes depend for their production upon rays of much greater wave-length. Many changes are known, for example, which are undoubtedly induced by the action of the red and infra-red rays, which have been ordinarily classified as "heat rays." (Consult Tyndall, 'Contributions to Molecular Physics in the Domain of Radiant Heat').

The action of light upon a gaseous mixture composed of equal volumes of hydrogen and chlorine has been studied extensively, chiefly by Draper and by Bunsen and Roscoe. When a mixture of this kind is exposed to strong sunlight, its constituents combine explosively, with the formation of hydrochloric acid gas; but when exposed to a subdued light, they combine slowly and with considerable regularity. Draper invented an instrument (the "actinometer") for the measurement of the actinic power of a given source of light, basing its operation upon the rapidity with which combination takes place in a mixture of hydrogen and chlorine, when exposed to the light whose chemical power is to be determined. The instrument consisted of a bulb that was filled partially with water and partially with the mixed bases and which was also provided with a graduated capillary stem, in which a column of mercury or of water served as an index for the determination of any change of volume in the gaseous mixture in the bulb. When the bulb was exposed to a subdued light for a definite time, the hydrogen and chlorine combined partially and the hydrochloric acid gas that was formed was almost immediately absorbed by the water, in which it is exceedingly soluble. The volume of the gases in the bulb, therefore, suffered a reduction, which was proportional to the total amount of chemical change induced by the light; and the extent of this reduction in volume was indicated by the movement of the index-liquid in the graduated stem of the instrument. Draper's actinometer was open to two general objections. In the first place (as Draper himself discovered in 1843), the combination of hydrogen and chlorine, in a diffuse light, does not proceed at a rate that is strictly proportional to the time. The further researches of Bunsen and Roscoe showed that the action of the light, in Draper's actinometer, is at first very slow indeed and that the rate of combination increases, after the lapse of a certain time, up to a maximum value which is thereafter constantly maintained. In some of the experiments it was found that the chemical action during the seventh minute of exposure of the instrument was nearly as great as the total action during the first six minutes and that the action during the eighth minute was 50 per cent greater than that during the seventh minute. In these particular experiments the instrument could not be relied upon until after the lapse of eight minutes; and the initial period of irregularity would of course be different under other intensities of illumination. Great differences in the indication of the Draper instrument were also found to result from apparently trivial variations in the relative quantities of hydrogen and chlorine present. The second objection to the Draper actinometer is that it can indicate nothing but the power of the light under examination to induce the combination of hydrogen and chlorine, or to perform some other change that depends upon light of the same wave-length as that concerned in this particular effect. A similar objection may be urged, it is true, against every form of actinometer; for no instrument can be constructed, which will indicate anything about light of other wave-lengths than those that are concerned in its own operation. The point of

the criticism is, however, that in estimating the power of a given light to perform a given kind of chemical change, it is essential that the actinometer adopted shall depend for its action upon the same wave-lengths as those concerned in the phenomenon for whose study the actinometer is employed. It is not logical, for example, to use the Draper actinometer for determining the power of a given light to effect the reduction of the halogen salts of silver, unless it is first proved that the combination of hydrogen and chlorine, and the blackening of silver salts, are effected by the action of light-rays of substantially equal wave-lengths. The commonest problem in actinometry at the present time is the determination of the time of exposure in the taking of photographic pictures; and when an actinometer is employed for this purpose, it usually consists of a strip of sensitive paper which is exposed until it darkens to a definite shade; the time required for this blackening being taken as an index of the intensity of the light, so far as its power of reducing silver salts is concerned. It is possible the initial slowness with which diffuse daylight induces the combination of hydrogen and chlorine is a characteristic common, to a greater or lesser extent, to all photographic processes; but familiar experience in the taking of so-called "instantaneous" photographs indicates that if this initial slowness exists in the case of the modern dry-plate, its period is exceedingly short. Consult Draper, 'Scientific Memoirs' (1878); Derr, 'Photography for Students' (1906); Plotnikov, 'Photochemie' (1910); Nernst, 'Theoretische Chemie' (1913). Compare ACTINOMETER; PHOSPHORESCENCE; PHOTOGRAPHY.

PHOTOENGRAVING, a general term covering various processes by which the action of light upon suitably sensitive surfaces is made to yield plates from which facsimiles of photographs or drawings may be printed. The processes commonly and very successfully employed at present are dependent upon the properties of various substances such as gelatine or similar bodies to undergo certain changes under the action of light.

If a thin layer of asphaltum is spread upon a metal plate and exposed to the light under a negative or positive, the parts under the clear portions of the screen either positive or negative become insoluble, while those under the dense parts remain soluble. When the plate is then washed with a suitable solvent, the soluble parts will be removed, the hardened parts remaining. The plate can then be etched, the asphaltum serving as an etching ground. The result is a relief plate, if the black parts of the design were hardened under a negative; an intaglio plate, if the whites were hardened under a positive.

Albumen, or white of egg, is soluble in cold water even if allowed to dry. If mixed with a solution of potassium bichromate and spread upon a surface and dried, it still remains soluble as long as it is not exposed to light. Albumen when combined with potassium bichromate acts like asphaltum, subject to certain modifications in handling.

If gelatine is mixed with potassium bichromate it retains its qualities if left in the dark, but exposed to light it acquires the power of

resistance to mordants according to the degree of exposure. These peculiarities of the various substances mentioned have been used to further the work of the photo-mechanical processes. The aim of them all is to reproduce any photograph or drawing into a printing plate without the intervention of other than mechanical means.

The familiar half-tone, so generally employed in modern periodicals and books, is a very beautiful and successful result of the special application of the action of light upon a properly prepared copper plate. It is dependent for its printing qualities upon the interposition of the so-called half-tone screen between the object photographed and the negative. This screen is made up of pieces of glass that have been very finely ruled and put together in such a way as to make of the intersecting lines a great number of minute dots. The effect of this upon the negative is to break up the flat surfaces into a corresponding texture of dots, their size depending upon the relative darks and lights of the original. It is in fact a general stippling of the surface, affording a grain to which the ink may cling. The fineness or delicacy of the resulting plate is dependent upon the character of the screen used. In some of the most beautiful reproductions of to-day, there are as many as 200 dots to the inch. In such cases, however, successful printing is only possible with the very finest paper and the most experienced and careful press work. For ordinary magazine work the screen is usually 125 to 150 dots to the inch, while 100, 80 and 70-line screens are common for newspaper printing.

In making the half-tone a negative in reverse made with the screen is put into contact with a highly polished metal plate, usually copper, which has been properly sensitized or coated with a preparation of fish glue, bichromate of ammonia, albumen and water. It is then exposed to the light and afterward washed in water. Those parts which have been protected from the light by the denser portion of the negative are washed out and the other portions in varying degrees. The plate is then dried and burned in over a suitable heater, when it is ready for etching. Few half-tones are satisfactory without considerable artistic hand-work to perfect them. Much depends upon the skill of the photographer and upon the degree of etching.

The half-tone, more than any other of the photo-mechanical processes, has helped to advance and develop American illustrative art. Before its employment, drawings in wash or color had to be redrawn on the wood block in black and white and in reverse. This limited both the mediums employed and greatly hampered the comparatively few artists who had either the time or inclination to learn to draw in the special way required. With the advent of the half-tone, artists could draw as they chose; size was unimportant, for the photographic reproduction allowed for any reduction necessary. Again, there were artists whose work suffered materially at the hands of the engraver; the resulting print was only a fair interpretation, not a facsimile in black and white. The relative small cost of the half-tone has permitted of the freer use of illustrations, and has brought out the work of many men who have attained high places in American art. There have been

many claimants for the invention of the half-tone, but it is generally conceded that Ives of Philadelphia was one of the first to make it practicable.

Frederick E. Ives invented the first successful half-tone process and half-tone three-color printing in 1878, when he had charge of the photographic laboratory at Cornell University. The half-tone process was simplified in operation in 1880, introduced commercially in Philadelphia in February 1881, and patents issued in the same year. This was a photo-mechanical process, the translation of the body shades of the photograph into definite line and dot, as required for typographic printing, depending upon the relation of ruled V-shaped lines to the uneven surface of a photogelatine relief.

The half-tone process now universally employed was the result of Mr. Ives' effort in 1885 to obtain the results more directly and economically, by substituting the application of an optical V line to a camera image for the application of the ruled V line to the photogelatine relief. The crossline sealed screen and the regulation of the gradation of line and dot by screen distance and special lens diaphragms was a part of the invention as operated by Ives in 1886, and afterward taught to others, but not patented.

The Meisenbach process, patented in 1882, was the first screen process to be used in a large way. The half-tone is most valued for the reproduction of photographs or drawings in which there are tints and masses involving delicate gradations.

For the reproduction of drawings in line or solids, the zinc etching process is employed, being less costly and more rapid. In this work the metal employed is usually a zinc plate coated with albumen mixed with bichromate and exposed under a reversed black and white negative made from the drawing to be reproduced. After exposure it is washed with a solvent that removes the unchanged part of the coating, leaving the lines of the design in hardened albumen upon the plate. It is then etched into relief and the rough places gone over with a graver and the blank spaces or pure whites routed out. It is then mounted on a block type-high and is ready to print.

Another familiar process employed in the reproduction of line work is known as the swell gelatine process. A bichromatized gelatine film is laid on a glass plate and exposed under a black and white negative. The film is then soaked in water, which causes the lines protected by the dark parts of the negative to swell up while the others do not swell. The film is then a mold or matrix from which a wax or plaster impression may be taken, and from this an electrotpe can be made. This is a more difficult and uncertain process, however, and is not very generally employed.

Another most beautiful process involving just the reverse of the methods employed in the half-tone is known as photogravure. It may be employed either in the reproduction of drawings, in tint or pure line, and because of the absence of sharp lines and dots there results a fascinating richness of texture, a velvety quality that is especially adapted for the reproduction of paintings or old etchings. Some of the most sumptuous and valuable art works of our

time are illustrated by the use of the photogravure, and it is constantly employed in the reproduction of drawings and prints of the old masters. One of the simpler methods of producing a photogravure plate is as follows: A copper-plate covered with asphaltum or albumen mixed with a bichromate is exposed under a black and white positive. The parts under the clear spaces of the positive are hardened; those under the opaque places corresponding to the lines of the original remain soluble. Washing with a solvent bares the metal in the soluble places, and the plate is then etched, the hardened coating forming a resist. A grain is obtained in this process by first sprinkling the plate with powdered resin which is made to adhere by heating. Photo-aquatint is another familiar method for the reproduction of intaglio half-tone plates. There are a number of processes known under various names that are somewhat similar in general character and involve adaptations in the use of sensitized gelatine. Among these the best known are the Woodburytype, the stannotype, the heliotype, the collotype and the autotype.

With the advent of color in the pages of our leading magazines, a new impetus has been given toward the development of methods by which direct reproductions can be made of colored originals. The so-called three-color process is based upon the theory that all the colors in the chromatic scale may be derived from the three primaries, red, blue and yellow. In making the half-tone negatives from a colored original, ray filters are used, which are transparent color mediums that permit only certain rays to be effective in the photographic plate. The resulting plates printed the one upon the other in just the proper shades of red, blue and yellow, ought to result, theoretically, in an exact copy of the original. As a matter of fact these color reproductions are but approximate. However, with the aid of a keyplate, printed in black or photo-brown, and by ingenious mechanical aids, the three-color or four-color work has been brought to a marvelous degree of perfection, and is generally employed for magazine covers and colored inserts.

In all of the various processes employed in photo-engraving, much has to be left to the skill of the operator. Certainly we owe much to the men who have done their part toward furthering the advancement of the mechanical processes. While the general principles and processes employed in these reproductive arts are well known and common property, there are yet many special adaptations and more or less secret methods that have grown out of special experimentation and experience.

Modern art has been brought into the household by our illustrative magazines and papers, and the art of all time can be studied in the cheap reproductions made possible by these modern photographic processes. For the photolithographic process see PHOTO LITHOGRAPHY.

The photo-engraving industry in the United States in 1914 included 376 establishments, employing 6,211 people, besides 1,771 employed in this work in connection with printing offices. The total production of both was \$17,559,000.

J. B. CARRINGTON,
Assistant Editor (*Scribner's Magazine*.)
